# Income, Poverty, and Health Insurance Coverage in the United States: 2009 

Carmen DeNavas-Walt, with the assistance of Margaret E. Richardson and Melissa A. Stringfellow, prepared the income section of this report under the direction of Edward J. Welniak, Jr., Chief of the Income Statistics Branch. Bernadette D. Proctor prepared the poverty section under the direction of Trudi J. Renwick, Chief of the Poverty Statistics Branch. Jessica C. Smith prepared the health insurance coverage section under the direction of Brett O'Hara, Chief of the Health and Disability Statistics Branch. Charles T. Nelson, Assistant Division Chief for Economic Characteristics, and Jennifer Cheeseman Day, Assistant Division Chief for Employment Characteristics, both of the Housing and Household Economic Statistics Division, provided overall direction.

Adelle D. Berlinger, George M. Mitcham, Tim J. Marshall, and Gregory D. Weyland, Demographic Surveys Division, processed the Current Population Survey 2010 Annual Social and Economic Supplement file. Donna K. Benton, Kirk E. Davis, Thy K. Le, and Chandararith R. Phe, all of the Survey Processing Branch, programmed and produced the detailed and publication tables.

Danielle N. Castelo, Rebecca A. Hoop, and Matthew R. Herbstritt, under the supervision of David V. Hornick and Kimball T. Jonas, all of the Demographic Statistical Methods Division, conducted sample review. Thomas F. Moore, Chief of the Health Surveys and Supplements Branch, provided overall direction.

Lisa Clement, Tim J. Marshall, Michelle Wiland, and Lisa Paska, Demographic Surveys Division, and Roberto Picha and Agatha Jung,Technologies Management Office, prepared and programmed the computer-assisted interviewing instrument used to conduct the Annual Social and Economic Supplement.

Additional people within the U.S. Census Bureau also made significant contributions to the preparation of this report. Barton Baker, Ashley Edwards, Suzanne Macartney, Laryssa Mykyta, Ashley Provencher, Jessica L. Semega, Bruce H. Webster, Jr., John Hisnanick, Len Norry, and Judith Waldrop reviewed the contents.

Census Bureau field representatives and telephone interviewers collected the data. Without their dedication, the preparation of this report or any report from the Current Population Survey would be impossible.

Linda Chen, Jamie A. Stark, and Donald J. Meyd, of the Administrative and Customer Services Division, Francis Grailand Hall, Chief, provided publications and printing management, graphics design and composition, and editorial review for print and electronic media. General direction and production management were provided by Claudette E. Bennett, Assistant Division Chief.

# Income, Poverty, and <br> Health Insurance Coverage in the United States: 2009 

## Introduction

This report presents data on income, poverty, and health insurance coverage in the United States based on information collected in the 2010 and earlier Current Population Survey Annual Social and Economic Supplements (CPS ASEC) conducted by the U.S. Census Bureau.

Summary of findings:

- The median household income in 2009 was not statistically different from the 2008 median in real terms. ${ }^{1}$
- The poverty rate increased between 2008 and 2009.
- The uninsured rate and number of people without health insurance increased between 2008 and 2009.

These results were not uniform across groups. For example, between 2008 and 2009, real median household income declined for non-Hispanic Whites and Blacks, while the changes for Asians and Hispanics were not

[^0]
## Source of Estimates and Statistical Accuracy

The data in this report are from the 2010 Current Population Survey Annual Social and Economic Supplement (CPS ASEC) and were collected in the 50 states and the District of Columbia and do not represent residents of Puerto Rico and U.S. island areas.* It is based on a sample of about 100,000 addresses. The estimates in this report are controlled to independent national population estimates by age, sex, race, and Hispanic origin for March 2010. The population controls used to prepare estimates for 1999 to 2009 were based on the results from Census 2000 and are updated annually using administrative records for such things as births, deaths, emigration, and immigration.

The CPS is a household survey primarily used to collect employment data. The sample universe for the basic CPS consists of the resident civilian noninstitutionalized population of the United States. People in institutions, such as prisons, long-term care hospitals, and nursing homes, are not eligible to be interviewed in the CPS. Students living in dormitories are only included in the estimates if information about them is reported in an interview at their parents' home. The sample universe for the CPS ASEC is slightly larger than that of the basic CPS since it includes military personnel who live in a household with at least one other civilian adult, regardless of whether they live off post or on post. All other Armed Forces are excluded. For further documentation about the CPS ASEC, see <www.census.gov/apsd/techdoc/cps/cpsmar10.pdf>.

Most of the data from the CPS ASEC were collected in March (with some data collected in February and April). The estimates in this report (which may be shown in text, figures, and tables) are based on responses from a sample of the population and may differ from actual values because of sampling variability or other factors. As a result, apparent differences between the estimates for two or more groups may not be statistically significant. All comparative statements have undergone statistical testing and are significant at the 90 percent confidence level unless otherwise noted. Further information about the source and accuracy of the estimates is available at <www.census.gov/hhes/www/p60_238sa.pdf>.

[^1]statistically significant. ${ }^{2}$ The poverty rate increased for non-Hispanic Whites, Blacks, and Hispanics, while the change for Asians was not statistically significant. Additionally, for health insurance, the uninsured rate and number of uninsured increased for non-Hispanic Whites, Blacks, and Hispanics, while the changes for

[^2] of approaches.

In this report, the term "non-Hispanic White" refers to people who are not Hispanic and who reported White and no other race. The Census Bureau uses non-Hispanic Whites as the comparison group for other race groups and Hispanics.

Because Hispanics may be any race, data in this report for Hispanics overlap with data for race groups. Being Hispanic was reported by 12.9 percent of White householders who reported only one race, 2.9 percent of Black householders who reported only one race, and 2.0 percent of Asian householders who reported only one race.

The small sample size of the Asian population and the fact that the CPS does not use separate population controls for weighting the Asian sample to national totals contribute to the large variances surrounding estimates of this group.
This means that for some estimates for the Asian population, we are unable to detect statistically significant changes from the previous year. The American Community Survey (ACS), based on a much larger sample size of the population, is a better source for estimating and identifying changes for small groups of the population, such as the Asian population.

The householder is the person (or one of the people) in whose name the home is owned or rented and the person to whom the relationship of other household members is recorded. If a married couple owns the home jointly, either the husband or the wife may be listed as the householder. Since only one person in each household is designated as the householder, the number of householders is equal to the number of households. This report uses the characteristics of the householder to describe the household.

Data users should exercise caution when interpreting aggregate results for the Hispanic population or for race groups because these populations consist of many distinct groups that differ in socioeconomic characteristics, culture, and recency of immigration. In addition, the CPS does not use separate population controls for weighting the Asian sample to national totals. Data were first collected for Hispanics in 1972 and for Asians and Pacific Islanders in 1987. For further information, see <www.bls.census.gov /cps/ads/adsmain.htm>.

Asians were not statistically significant. These results are discussed in more detail in the three main sections of this report-income, poverty, and health insurance coverage. Each section presents estimates by characteristics such as race, Hispanic origin, nativity, and region. Other topics covered are earnings of workers,
including full-time, year-round workers; families in poverty; and health insurance coverage of children.

The income and poverty estimates shown in this report are based solely on money income before taxes and do not include the value of noncash benefits, such as nutritional assistance,

## Supplemental Poverty Measure

On March 2, 2010, the Interagency Technical Working Group (which included representatives from the Bureau of Labor Statistics [BLS], U.S. Census Bureau, Economics and Statistics Administration, Council of Economic Advisers, U.S. Department of Health and Human Services, and Office of Management and Budget [OMB]) issued a series of suggestions to the Census Bureau and BLS on how to develop the Supplemental Poverty Measure. Their suggestions drew on the recommendations of a 1995 National Academy of Sciences report and the extensive research on poverty measurement conducted over the past 15 years.

The new thresholds are not intended to assess eligibility for government programs and will not replace the official poverty thresholds. Instead, the new measure will serve as an additional indicator of economic well-being and will provide a deeper understanding of economic conditions and policy effects. The official poverty measure, which has been in use since the 1960s, estimates poverty rates by looking at a family's or an individual's cash income. The new measure will be a more complex statistic incorporating additional items, such as tax payments and work expenses, in its family resource estimates. Thresholds used in the new measure will be derived from Consumer Expenditure Survey expenditure data on basic necessities (food, shelter, clothing, and utilities) and will be adjusted for geographic differences in the cost of housing. Additional details can be found at <www.census.gov/hhes/www/poverty/SPM_TWGObservations.pdf>.

The Census Bureau's statistical experts, with assistance from BLS and in consultation with other appropriate agencies and outside experts, will be responsible for the measure's technical design. Over 75 comments were received in response to a May 2010 federal register notice regarding the measure. The Census Bureau has embarked on an ambitious research agenda, which includes an assessment of alternative definitions of the poverty unit, an investigation of alternative data sources for geographic cost-of-living adjustments, and an evaluation of the reliability of the data from questions added to the Annual Social and Economic Supplement to the Current Population Survey (CPS ASEC) in 2010. The Census Bureau plans to publish documentation on these and other technical aspects of the new measure before the end of this year.

If the President's budget initiative is approved, the Census Bureau will publish the first set of poverty estimates using the new approach in September 2011. Both the Census Bureau and the Interagency Technical Working Group consider the Supplemental Poverty Measure a work in progress and expect that there will be improvements to the statistic over time.

Medicare, Medicaid, public housing, and employer-provided fringe benefits.

Since the publication of the first official U.S. poverty estimates in 1964, there has been continuing debate about the best approach to measuring income and poverty in the United States.

Recognizing that supplemental estimates of income and poverty can provide useful information to the public as well as to the federal government, in 2009, the Office of Management and Budget's (OMB) Chief Statistician formed the Interagency Technical Working Group on Developing the Supplemental Poverty Measure. This group asked the Census Bureau, in cooperation with the Bureau of Labor Statistics (BLS), to develop the new statistic. The measure is designed to obtain an improved understanding of the economic well-being of American families and how federal policies affect those living in poverty. The text box "Supplemental Poverty Measure" provides more information.

The CPS is the longest-running survey conducted by the Census Bureau. The CPS ASEC asks detailed questions categorizing income into over 50 sources. The key purpose of the CPS ASEC is to provide timely and detailed estimates of income, poverty, and health insurance coverage and to measure change in those estimates at the national level. The CPS ASEC is the official source of the national poverty estimates calculated in accordance with OMB's Statistical Policy Directive No. 14 (Appendix B).

The Census Bureau also reports income, poverty, and health insurance coverage estimates based on data from the American Community Survey (ACS). The ACS is part of the 2010 Census program and has eliminated the need for a long-form census questionnaire. The ACS offers
broad, comprehensive information on social, economic, and housing topics and provides this information at many levels of geography, particularly for local communities.

Since the CPS ASEC produces more complete and thorough estimates of income and poverty, the Census Bureau recommends that people use it as the data source for national estimates. Estimates for income, poverty, health insurance coverage, and other economic characteristics at the state level can be found in forthcoming briefs based on data from the 2009 ACS. For more information on state
and local estimates, see the text box "State and Local Estimates of Income, Poverty, and Health Insurance."

The CPS ASEC provides reliable estimates of the net change, from one year to the next, in the overall distribution of economic characteristics of the population, such as income and earnings, but it does not show how those characteristics change for the same person, family, or household. Longitudinal measures of income, poverty, and health insurance coverage that are based on following the same people over time are available from the Survey of Income and

## State and Local Estimates of Income, Poverty, and Health Insurance

The U.S. Census Bureau presents annual estimates of median household income, poverty, and health insurance coverage by state and other smaller geographic units based on data collected in the American Community Survey (ACS). Single-year estimates are available for geographic units with populations of 65,000 or more. The ACS also produces estimates of income and poverty for counties and places with populations of 20,000 or more by pooling 3 years of data. Before the end of this year, 5-year income and poverty estimates will be available for all geographic units, including census tracts and block groups. (Since questions on health insurance coverage were added to the ACS in 2008, 3-year estimates for health insurance coverage will not be available until next year. Five-year health insurance coverage estimates for the smallest geographic units will be available in 2013.)

The Census Bureau's Small Area Income and Poverty Estimates (SAIPE) program also produces single-year estimates of median household income and poverty for states and all counties, as well as population and poverty estimates for school districts. These estimates are based on models using data from a variety of sources, including current surveys, administrative records, intercensal population estimates, and personal income data published by the Bureau of Economic Analysis. In general, SAIPE estimates have lower variances than ACS estimates but are released later because they incorporate ACS data in the models. Estimates for 2008 are available at <www.census.gov/did/www/saipe/index.html>. Estimates for 2009 will be available later this year.

The Census Bureau's Small Area Health Insurance Estimates (SAHIE) program produces model-based estimates of health insurance coverage rates for states and counties. The SAHIE program released 2007 estimates of health insurance coverage by age, sex, race, Hispanic origin, and income categories at the state level and by age, sex, and income categories at the county level in 2010. These estimates are available at <www.census.gov /did/www/sahie/index.html>.

Program Participation (SIPP). Estimates derived from SIPP data answer questions such as:

- What percentage of households move up or down the income distribution over time?
- How many people remain in poverty over time?
- How long do people without health insurance tend to remain uninsured?

The text box "Dynamics of Economic Well-Being" provides more information.

## INCOME IN THE UNITED STATES

## Highlights

- The real median household income in 2009 was $\$ 49,777$, not statistically different from the 2008 median (Table 1 and Figure 1).
- Real median income declined by 1.8 percent for family households and increased 1.6 percent for nonfamily households between 2008 and 2009 (Table 1).

## Dynamics of Economic Well-Being

The Survey of Income and Program Participation (SIPP) provides monthly data about labor force participation, income sources and amounts, and health insurance coverage of individuals, families, and households during the time span covered by each of its panels. The data yield insights into the dynamic nature of these experiences and the economic mobility of U.S. residents.* For example, the data demonstrate that using a longer time frame to measure poverty (e.g., 4 years) yields, on average, a lower poverty rate than the annual measures presented in this report, while using a shorter time frame (e.g., 2 months) yields higher poverty rates. Some specific findings from the 2004 panel include:

- The proportion of households in the bottom income quintile in 2004 that moved up to a higher quintile in 2007 ( 30.9 percent) was not statistically different from the proportion of households in the top quintile in 2004 that moved to a lower quintile in 2007 ( 32.2 percent).
- Households with householders who had lower levels of education were more likely to remain in or move into a lower income quintile than households whose householders had higher levels of education.
- Approximately 31.6 percent of the population had at least one spell of poverty lasting 2 or more months during the 4 -year period from 2004 to 2007.
- Chronic poverty was relatively uncommon, with 2.2 percent of the population living in poverty all 48 months of the period.

More information based on these data is available in a series of reports titled the Dynamics of Economic Well-Being, as well as in table packages and working papers.

The U.S. Census Bureau is in the process of reengineering the SIPP. The redesigned survey is expected to reduce respondent burden and attrition and deliver data on a timely basis, while addressing the same topic areas of the earlier SIPP panels. For more information, see <www.sipp.census.gov/sipp>.

[^3]- Real median income declined for Black households and non-Hispanic White households between 2008 and 2009, while the changes for Asian and Hispanic-origin households were not statistically different (Table 1 and Figure 1).
- Native-born households and households maintained by a noncitizen had declines in real median income between 2008 and 2009. ${ }^{3}$ The changes in the median income of all foreign-born households and households maintained by a naturalized citizen were not statistically significant (Table 1).
- The Midwest and West experienced declines in real median household income between 2008 and 2009 (2.1 percent and 1.9 percent, respectively). ${ }^{4}$ The changes in median household incomes in the Northeast and South were not statistically significant (Table 1).
- The change in income inequality between 2008 and 2009 was not statistically significant, as measured by the shares of aggregate household income by quintiles and the Gini index (Tables 3 and A-2). ${ }^{5}$

* Statistically different from zero at the 90 percent confidence level.
${ }^{1}$ Medians are calculated using $\$ 2,500$ income intervals. Beginning with 2009 income data, the Census Bureau expanded the upper income intervals used to calculate medians to $\$ 250,000$ or more. Medians falling in the upper open-ended interval are plugged with " $\$ 250,000$." Before 2009, the upper open-ended interval was $\$ 100,000$ and a plug of " $\$ 100,000$ " was used.
${ }^{2}$ A 90 percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_238sa.pdf>
${ }^{3}$ Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table shows data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White and American Indian and Alaska Native or Asian and Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000. Data for American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders, and those reporting two or more races are not shown separately in this table.
${ }^{4}$ The "Outside metropolitan statistical areas" category includes both micropolitan statistical areas and territory outside of metropolitan and micropolitan statistical areas. For more information, see "About Metropolitan and Micropolitan Statistical Areas" at <www.census.gov/population/www/estimates/aboutmetro.html>
${ }^{5}$ The data shown in this section are per capita incomes and their respective confidence intervals. Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population in that group (excluding patients or inmates in institutional quarters).

* Statistically significant at the 90 percent confidence level.
${ }^{1}$ Recessions are determined by the National Bureau of Economic Research, a private research organization.
Note: Income years are based on peak income year prior to or during the start of the recession and the trough income year near or after the end of the recession. Source: U.S. Census Bureau, Current Population Survey, 1970 to 2010 Annual Social and Economic Supplements.
- Both men and women, 15 years old and over, who worked full-time, year-round experienced increases in real median earnings between 2008 and 2009. The median earnings of men increased 2.0 percent, from $\$ 46,191$ to $\$ 47,127$; and the earnings of women increased by 1.9 percent, from $\$ 35,609$ to $\$ 36,278 .{ }^{6}$ In 2009, the female-tomale earnings ratio was 0.77 , not statistically different from the 2008 ratio (Table 1 and Figure 2).
- The median earnings of all working males 15 years old and over was $\$ 36,331$ in 2009, not statistically different from their 2008 median, while the earnings of their female counterparts increased by 1.9 percent, from $\$ 25,553$ to $\$ 26,030$ (Table A-4).
- Real per capita income declined by 1.2 percent for the total population, 1.3 percent for Whites, and 3.5 percent for Hispanics between

[^5]2008 and 2009. ${ }^{7}$ The changes for non-Hispanic Whites, Blacks, and Asians were not statistically significant (Table 1). ${ }^{8}$

## Household Income

Real median household income was $\$ 49,777$ in 2009, not statistically different from the 2008 median. Since 2007, the year before the most recent recession, median household income has declined 4.2 percent (from $\$ 51,965$ ) and is 5.0 percent below the median household income peak $(\$ 52,388)$ that occurred in 1999 (Tables 1, 2, and A-1). ${ }^{9}$ Though the trough of the recession that began in December 2007 has not yet been

[^6]defined, the 4.2 percent income decline is: ${ }^{10}$

- Not statistically different from the declines in income for the years surrounding the two recessions lasting from March 2001 to November 2001 and from July 1990 to March 1991.
- Larger than the 1.7 percent decline for the income years surrounding the December 1969 to November 1970 recession. ${ }^{11}$
- Smaller than the declines for the income years surrounding the January 1980 to July 1980 and July 1981 to November 1982 combined recessions ( 6.0 percent) and the November 1973 to March 1975 recession ( 5.7 percent) (Figure 1 and Tables 1, 2, and A-1). ${ }^{12}$

[^7]
## Race and Hispanic Origin

Real median income declined for Black households and non-Hispanic White households between 2008 and 2009 (Table 1 and Figure 1); the changes for the Asian and Hispanic-origin households were not statistically significant. The decline for Black households was 4.4 percent, larger than the 1.6 percent decline for non-Hispanic White households.

In comparison to the respective income peaks before the 2001 recession, 2009 household income was 5.0 percent lower for all races combined (from $\$ 52,388$ in 1999), 4.2 percent lower for non-Hispanic Whites (from $\$ 56,843$ in 1999), 11.8 percent lower for Blacks (from $\$ 36,952$ in 2000), 5.7 percent lower for Asians (from $\$ 69,448$ in 2000), and 7.9 percent lower for Hispanics (from \$41,312 in 2000). ${ }^{13}$

Among the race groups, Asian households had the highest median income in $2009(\$ 65,469)$. The median income for non-Hispanic-White households was \$54,461; for Black households it was $\$ 32,584$; and for Hispanic households it was $\$ 38,039$. Comparing the income of non-Hispanic-White households to that of other households shows that the 2009 ratio of Asian to non-HispanicWhite income was 1.20 , the ratio of Black to non-Hispanic-White income was 0.60 , and the ratio of Hispanic to non-Hispanic-White income was 0.70. Between 1972 (the first year that income data for the Hispanic

[^8]and non-Hispanic-White populations were collected in the CPS ASEC) and 2009, the Black-to-non-HispanicWhite income ratio increased from 0.58 to 0.60 . Over the same period, the Hispanic-to-non-Hispanic-White income ratio declined from 0.74 to 0.70. Income data for the Asian population was first available in 1987. The Asian-to-non-Hispanic White income ratios for 1987 and 2009 were not statistically different, 1.14 and 1.20 , respectively.

## Age of Householder

Change in real median household income by age of the householder between 2008 and 2009 was not uniform across the age groups. The median income of households with householders under 65 declined ( 1.3 percent), while the income of households with householders 65 and older increased ( 5.8 percent). More precisely, declines in median income were experienced by households with householders aged 15 to 24 (4.4 percent decline), 25 to 34 ( 2.0 percent decline), and 35 to 44 ( 2.6 percent decline). Changes in the incomes of households with householders aged 45 to 54 and 55 to 64 were not statistically significant. ${ }^{14}$

## Nativity

Native-born households and households maintained by a noncitizen had declines in real median income between 2008 and 2009. The changes in the median income of foreignborn households and households maintained by a naturalized citizen were not statistically significant. The decline for native-born households was 0.7 percent, and for households maintained by a noncitizen, the decline was 4.5 percent. In 2009,

[^9]households maintained by naturalized citizens had the highest income, $\$ 51,975$; followed by native-born households, \$50,503; and noncitizen households, \$36,089 (Table 1).

## Region ${ }^{15}$

Real median household income in the Midwest and West experienced declines of 2.1 percent and 1.9 percent between 2008 and 2009 (Table 1). ${ }^{16}$ The changes in the median incomes in the Northeast and South were not statistically significant. In 2009, households in the West $(\$ 53,833)$ and Northeast $(\$ 53,073)$ had the highest median household incomes, followed by the Midwest $(\$ 48,877)$ and the South (\$45,615). ${ }^{17}$

## Residence

Between 2008 and 2009, both households inside and outside of principal cities within metropolitan areas experienced changes in real median income, but in opposite directions (Table 1). Households inside principal cities experienced a 1.9 percent increase in income, whereas households outside principal cities experienced a 1.9 percent decline. In 2009, households within metropolitan areas but outside principal cities had the highest median income $(\$ 56,582)$, and households outside metropolitan areas had the lowest $(\$ 40,135)$.
${ }^{15}$ The Northeast region includes Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont. The Midwest region includes Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. The South region includes Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia, and the District of Columbia, a state equivalent. The West region includes the states of Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.
${ }^{16}$ The difference in the declines in median household income between the Midwest and West was not statistically significant.
${ }^{17}$ The difference between the median household incomes for the West and Northeast was not statistically significant.

## Income Inequality

The Census Bureau has traditionally used two methods to measure income inequality: (1) the shares of aggregate household income received by quintiles and (2) the Gini index. In addition to these measures, the Census Bureau also produces estimates of the ratio of income percentiles, the Theil index, the mean logarithmic deviation of income (MLD), and the Atkinson measures. ${ }^{18}$

The change in income inequality between 2008 and 2009 was not statistically significant as measured by the shares of aggregate household income by quintiles, the Gini index, the MLD, or Atkinson measures. The Theil index was the only inequality measure to show a statistically significant change-a 1.3 percent increase (Tables 3 and A-2). In 2009, the share of aggregate income received by the bottom quintile was 3.4 percent; the second quintile, 8.6 percent; the third, 14.6 percent; the fourth, 23.2 percent; and the highest quintile, 50.3 percent. Households in the lowest quintile had incomes of $\$ 20,453$ or less; those in the second quintile had incomes ranging from $\$ 20,454$ to $\$ 38,550$; those in the third quintile had incomes ranging from $\$ 38,551$ to $\$ 61,801$; those in the fourth quintile had incomes ranging from $\$ 61,802$ to $\$ 100,000$; and those in the highest quintile had incomes of $\$ 100,001$ or more.

The Gini index was 0.468 in 2009. Except for the 1.5 percent decline in the Gini index between 2006 and 2007, there were no other statistically significant annual changes since 1993, the earliest year available for comparable measures of income inequality. ${ }^{19}$ Since 1993, the Gini

[^10]index is up 3.1 percent. (Table A-2 lists historical money income inequality measures. ${ }^{20}$

Between 2008 and 2009, the changes in the real household income at the 50th (median), 10th, and 90th percentiles were not statistically significant (Table A-2). However, comparing the change in household income between 1999, the year that household income peaked before the 2001 recession, and 2009 suggests income inequality is increasing. Income at the 50th and 10th percentiles declined- 5.0 percent and 9.0 percent, respectively-while the change in income at the 90th percentile was not statistically significant. Between 1999 and 2009, the 90th-to-the-10th-percentile income ratio increased from 10.42 to 11.36 .

## Equivalence-Adjusted Income Inequality

Another way to measure income inequality is using an equivalenceadjusted income estimate, which takes into consideration the number of people living in the household and how these people share resources and take advantage of economies of scale. For example, the money-incomebased distribution treats income of $\$ 30,000$ for a single-person household and a family household similarly, while the equivalence-adjusted income of $\$ 30,000$ for a single-person household would be more than twice the equivalence-adjusted income of $\$ 30,000$ for a family household with two adults and two children. The equivalence adjustment used here is based on a three-parameter scale that reflects:

1. On average, children consume less than adults.

[^11]2. As family size increases, expenses do not increase at the same rate.
3. The increase in expenses is larger for a first child of a single-parent family than the first child of a twoadult family. ${ }^{21}$

Table 3 shows several income inequality measures, including aggregate income shares and the Gini index, using both money income and equivalence-adjusted income for 2008 and 2009. For both 2008 and 2009, the Gini index is lower based on the equivalence-adjusted income estimate than under the traditional money-income estimate, suggesting a more equal income distribution. Comparing the shares of aggregate household income received by quintile historically shows higher shares of income in the lower quintiles and lower shares in the higher quintiles for equivalence-adjusted income than for money income. This redistribution would be expected because at the lower end of the income distribution there is a higher concentration of single-person households and smaller family sizes in relation to those at the upper end of the distribution.

In 2009, the lowest quintile share of aggregate income for equivalenceadjusted income (3.4 percent) was not higher than the lowest quintile share of aggregate income for money income. This is the first time that shares of aggregate income in the lowest quintile for equivalenceadjusted income and money income were not statistically different.

[^12]Table 3.
Income Distribution Measures Using Money Income and Equivalence-Adjusted Income: 2008 and 2009
(For information on confidentiality protection, sampling error, nonsampling error, and definitions, see www.census.gov/apsd/techdoc/cps/cpsmar10.pdf)

| Measure | 2008 |  |  |  | 2009 |  |  |  | Percentage change |  |  |  |

[^13](Table A-3 lists historical equivalenceadjusted inequality measures.)

For equivalence-adjusted income, between 2008 and 2009, there was an increase in the Gini index and the redistribution of aggregate income shares, suggesting an increase in income inequality. Specifically, between 2008 and 2009, for the lowest quintile, the aggregate share of income decreased from 3.6 percent to 3.4 percent; and for the second quintile, the aggregate share of income declined from 9.4 percent to 9.2 percent. The changes between 2008 and 2009 in the aggregate shares for the middle, fourth, and highest quintiles were not statistically significant.

Each income inequality summary measure based on the
equivalence-adjusted income distribution showed a statistically significant increase between 2008 and 2009 (Table 3). The Gini index increased from 0.451 in 2008 to 0.458 in 2009-the second annual significant increase. The MLD, which measures the gap between the median and average income, increased 8.3 percent between 2008 and 2009. The Theil index is similar to the Gini index in that it is a single statistic that summarizes the dispersion of income across the entire income distribution. The Theil index increased from 0.380 to 0.394 between 2008 and 2009. The Atkinson measure, useful in determining which end of the distribution contributed most to inequality, increased between 2008 and 2009 for both high and low values of the epsilon (e)
parameter. ${ }^{22}$ Between 2008 and 2009, the Atkinson measure calculated with an $\mathrm{e}=0.25$ increased by 3.3 percent; and with $e=0.75$, it increased 4.5 percent. ${ }^{23}$

Table A-3 shows equivalence-adjusted measures of income distribution for income years 1967 to 2009. ${ }^{24}$ Over the 1967-to-2009 period, all equivalence-adjusted inequality measures increased more than the

[^14]Figure 2.

## Female-to-Male Earnings Ratio and Median Earnings of Full-Time, Year-Round Workers 15 Years and Older by Sex: 1960 to 2009

Note: Data on earnings of full-time, year-round workers are not readily available before 1960. For information on recessions, see Appendix A. Source: U.S. Census Bureau, Current Population Survey, 1961 to 2009 Annual Social and Economic Supplements.
money income inequality measures. The equivalence-adjusted Gini index increased 23.8 percent compared with 17.9 percent for the money income Gini index; the equivalenceadjusted MLD increased 88.9 percent compared with 44.7 percent for the money income MLD; the equivalenceadjusted Theil index increased 58.9 percent compared with 40.4 percent for the money income Theil index; and the equivalence-adjusted Atkinson measure increased at $\mathrm{e}=0.25$ by 55.7 percent, at $\mathrm{e}=0.50$ by 53.2 percent, and $e=0.75$ by 54.6 percent compared with 36.6 percent, 32.9 percent, and 30.9 percent, respectively for the money income Atkinson measure at each epsilon. ${ }^{25}$

[^15]
## Work Experience and Earnings

The number of working men and women aged 15 and older with earnings decreased between 2008 and 2009—men decreased by 2.1 million to 81.9 million and women decreased by 1.6 million to 73.0 million (Figure 3 and Table A-4). The number of full-time, year-round workers also decreased. ${ }^{26}$ The number of men who worked full-time, year-round decreased by 3.8 million (to 56.1 million), and the number of women who worked full-time, year round
${ }^{26}$ A full-time, year-round worker is a person who worked 35 or more hours per week (fulltime) and 50 or more weeks during the previous calendar year (year-round). For school personnel, summer vacation is counted as weeks worked if they are scheduled to return to their job in the fall. For detailed information on work experience, see Table PINC-05, "Work Experience in 2010-People 15 Years Old and Over by Total Money Earnings in 2010, Age, Race, Hispanic Origin, and Sex" at <www.census.gov/hhes /www/income/dinctabs.html>.
decreased by about 939,000 (to 43.2 million) between 2008 and 2009. An estimated 68.4 percent of working men with earnings and 59.2 percent of working women with earnings worked full-time, year-round in 2009, a decline of 2.8 percentage points for men (from 71.2 percent in 2008); for women, the change was not statistically significant.

The 2009 median earnings of all working men aged 15 and older, regardless of work experience, was \$36,331, not statistically different from the 2008 median in real terms; while that of their female counterparts increased by 1.9 percent to $\$ 26,030$ (Table A-4). Meanwhile, both men and women who worked full-time, yearround experienced increases in real median earnings between 2008 and 2009. Median earnings increased 2.0 percent for full-time, year-round working men (from $\$ 46,191$ to $\$ 47,127$ )
and 1.9 percent for women who worked full-time, year-round (from $\$ 35,609$ to $\$ 36,278) .{ }^{27}$ In 2009, the female-to-male earnings ratio of fulltime, year-round workers was 0.77, not statistically different from the 2008 ratio (Table 1 and Figure 2).

Since 2007, the year before the most recent recession, the number of working men with earnings decreased by 2.5 million (from 84.5 million to 81.9 million). The number of working women with earnings decreased by 1.3 million (from 74.3 million to 73.0 million) (Figure 3 and Table A-4). Between 2007 and 2009, the real median earnings of male workers declined by 4.1 percent (from $\$ 37,898$ to $\$ 36,331$ ) and for female workers by 2.8 percent (from $\$ 26,770$ to $\$ 26,030$ ). Though the trough of the recession that began in December 2007 has not yet been defined, no other set of income years surrounding the recessions dating from 1969 to the present has experienced such a large decline in the number of workers, or in the percentage-point declines in the percentage of male and female full-time, year-round workers (Figure 3 and Tables 2 and A-4). In addition, 2007 to 2009 is the only period (dating from 1969 to present) showing a decline in women's real median earnings. For men, the 2007 to 2009 decline in real median earnings is:

- Larger than the declines in earnings for the income years surrounding the March 2001 to November 2001 recession ( 2.6 percent decline) and the December 1969 to November 1970 recession (2.2 percent decline). ${ }^{28}$

[^16]- Smaller than the declines in earnings for the income years surrounding the recession lasting from July 1990 to March 1991 ( 6.0 percent decline); the January 1980 to July 1980 and July 1981 to November 1982 combined recessions ( 10.1 percent decline); and the November 1973 to March 1975 recession ( 6.4 percent decline). ${ }^{29}$

Between 2007 and 2009, the real median earnings of full-time, yearround male workers increased by 1.0 percent (from $\$ 46,669$ to $\$ 47,127$ ); the change was not statistically significant for full-time, year-round female workers, with a median of $\$ 36,278$ in 2009. However, between 2007 and 2009, the number of males working full-time, year-round with earnings decreased by 6.9 million; the number of females working full-time, year-round with earnings decreased by 2.4 million. Since the CPS ASEC is not a longitudinal survey, we cannot determine how the loss of these 9.3 million workers (who worked full-time, year-round in 2007 and did not work in 2009, or who worked full-time, year-round in 2007 and in 2009 worked less than full-time, year-round) affected median earnings (Tables 2 and A-4).
Examining the change between 2007 and 2009 in the number of workers with earnings by characteristics such as age, educational attainment, occupation, and class of worker shows that, in many cases, the number of male workers with earnings declined. Although the same can be said for their female counterparts, there were some cases in which the number of female workers increased.

Between 2007 and 2009, the number of male workers with earnings in the age groups 15 to 24 and 25 to 44 declined by 1.3 million and

[^17]1.4 million, respectively. For female workers with earnings, declines were evident in these age groups as well, 766,000 and 1.3 million, respectively; while the number of female workers 45 to 64 years old increased by 579,000 (Table A-5). ${ }^{30}$

Declines were evident in the number of male workers with earnings between 2007 and 2009 within the educational attainment categories of some college, no degree ( 678,000 decline), ninth to twelfth grade, nongraduate ( 348,000 decline), and those with less than a ninth grade education (234,000 decline). Declines were evident for female workers with earnings within the categories high school graduate (639,000 decline) and some college, no degree ( 646,000 decline); while female workers with an associate's degree or bachelor's degree or more increased (gains of 365,000 and 514,000, respectively). ${ }^{31}$
The occupation groups with statistically significant declines in the number of male workers with earnings between 2007 and 2009 were construction and extraction occupations ( 1.0 million decline), transportation and material-moving occupations (709,000 decline), production occupations ( 634,000 decline), and sales and related occupations ( 586,000 decline). Statistically significant declines in the number of female workers with earnings by occupation group occurred in management, business, and financial operations occupations (413,000 decline); office and administrative support occupations ( 1.3 million decline); and production occupations ( 712,000

[^18]Figure 3.
Total and Full-Time, Year-Round Workers With Earnings by Sex: 1967 to 2009

Note: Data on number of workers not readily available before 1967. People 15 years old and older beginning in 1980 and people 14 years old and older as of the following year for previous years. Before 1989, data are for civilian workers only. For information on recessions, see Appendix A.
Source: U.S. Census Bureau, Current Population Survey, 1968 to 2010 Annual Social and Economic Supplements.
decline). Between 2007 and 2009, women gained jobs in professional and related occupations (658,000 gain); service occupations (646,000 gain); and farming, fishing, and forestry occupations (87,000 gain). ${ }^{32}$

[^19]By class of worker, between 2007 and 2009, declines in the number of male workers with earnings occurred in the private wage and salary ( 2.3 million decline) and self-employed (426,000 decline) worker categories (Table A-5). For female workers with earnings, a decline of 1.4 million occurred in the private wage and salary worker category (Table A-5).

## Per Capita Income ${ }^{33}$

Real per capita income declined by 1.2 percent for the total population

[^20]between 2008 and 2009. ${ }^{34}$ In 2009, the per capita income for the overall population was $\$ 26,530$; for Whites it was $\$ 28,034$; for nonHispanic Whites, \$30,941; for Blacks, $\$ 18,135$; for Asians, $\$ 30,653$; and for Hispanics, \$15,063. ${ }^{35}$ Per capita income declined 1.3 percent for Whites and 3.5 percent for Hispanics (Table 1). ${ }^{36}$ The changes for nonHispanic Whites, Blacks, and Asians were not statistically significant.

[^21]
## POVERTY IN THE UNITED STATES ${ }^{37}$

## Highlights

- The official poverty rate in 2009 was 14.3 percent-up from 13.2 percent in 2008. This was the second statistically significant annual increase in the poverty rate since 2004 (Table 4 and Figure 4).
- In 2009, 43.6 million people were in poverty, up from 39.8 million in 2008-the third consecutive annual increase in the number of people in poverty (Table 4 and Figure 4).
- Between 2008 and 2009, the poverty rate increased for nonHispanic Whites (from 8.6 percent to 9.4 percent), for Blacks (from

[^22]24.7 percent to 25.8 percent), and for Hispanics (from 23.2 percent to 25.3 percent). For Asians, the 2009 poverty rate ( 12.5 percent) was not statistically different from the 2008 poverty rate (Table 4). ${ }^{38}$

- The poverty rate in 2009 (14.3 percent) was the highest poverty rate since 1994 but was 8.1 percentage points lower than the poverty rate in 1959, the first year for which poverty estimates are available (Figure 4).
- The number of people in poverty in 2009 ( 43.6 million) is the largest number in the 51 years for which poverty estimates have been published (Figure 4).
- Between 2008 and 2009, the poverty rate increased for children under the age of 18 (from 19.0 percent to 20.7 percent) and people aged 18 to 64 (from 11.7 percent to 12.9 percent), but decreased for
${ }^{38}$ The poverty rate for Blacks was not statistically different from that of Hispanics.
people aged 65 and older (from 9.7 percent to 8.9 percent) (Table 4). ${ }^{39}$

## Impact of the 2007 Economic Downturn

The poverty rate and the number in poverty increased by 1.9 percentage points and 6.3 million between 2007 and 2009 (Table 5). The increase in the overall poverty rate was:

- Larger than the increase in the poverty rate during the November 1973 to March 1975 recession. ${ }^{40}$
- Smaller than the increase in the poverty rates associated with the January 1980 to July 1980 and July 1981 to November 1982 combined recessions.

Between 2007 and 2009, the child poverty rate and the number in poverty increased by 2.7 percentage points and 2.1 million.
${ }^{39}$ Since unrelated individuals under 15 are excluded from the poverty universe, there are 460,000 fewer children in the poverty universe than in the total civilian noninstitutionalized population.
${ }^{40}$ The apparent changes in the poverty rates across the March 2001 to November 2001 and December 1969 to November 1970 recessions were not statistically different from zero.

Figure 4.

* Statistically different from zero at the 90 percent confidence level.
${ }^{1}$ Recessions are determined by the National Bureau of Economic Research, a private research organization.
${ }^{2}$ For comparability purposes, the 1989 poverty rate used in this calculation (13.1 percent) is based on data that reflect the implementation of the 1990 decennial census population controls. This poverty rate is different from the poverty rate shown in Table B-1, which is based on 1980 census population controls.

Note: Income years are based on peak income year prior to or during the start of the recession and the trough income year near or after the end of the recession.
Source: U.S. Census Bureau, Current Population Survey, 1970 to 2010 Annual Social and Economic Supplements.

## Race and Hispanic Origin

Both the poverty rate and the number in poverty increased for non-Hispanic Whites from 2008 to 2009 (9.4 percent and 18.5 million in 2009-up from 8.6 percent and 17.0 million in 2008) (Table 4). The poverty rate for non-Hispanic Whites was lower than the poverty rates for other race groups. Non-Hispanic Whites accounted for 42.5 percent of the people in poverty, compared with 64.9 percent of the total population.

For Blacks, the poverty rate and the number in poverty increased to 25.8 percent and 9.9 million in 2009, higher than 24.7 percent and 9.4 million in 2008. For Asians, the 2009 poverty rate ( 12.5 percent) was not statistically different from the 2008 rate, while the number of Asians in poverty increased from 1.6 million in 2008 to 1.7 million in 2009. Both the number in poverty and the poverty rate increased for Hispanics-1 2.4 million or 25.3 percent were in poverty in 2009, up from 11.0 million or 23.2 percent in $2008 .{ }^{41}$

[^24]
## Age

Between 2008 and 2009, both the poverty rate and the number in poverty increased for people aged 18 to 64 (from 11.7 percent and 22.1 million to 12.9 percent and 24.7 million). Both the poverty rate and the number in poverty decreased for people aged 65 and older (from 9.7 percent and 3.7 million to 8.9 percent and 3.4 million) (Table 4 and Figure 5).

Both the poverty rate and the number in poverty increased for children under the age of 18 (from 19.0 percent and 14.1 million in 2008 to 20.7 percent and 15.5 million in 2009). The poverty rate for children was higher than the rates for people aged 18 to 64 and those aged 65 and older (Table 4). Children comprised 35.5 percent of people in poverty but only 24.5 percent of the total population.

Related children are related to the householder by birth, marriage, or adoption and are not themselves householders or spouses of householders. ${ }^{42}$ Both the poverty rate and the number in poverty increased for related children under the age of 18 (from 18.5 percent and 13.5 million in 2008 to

[^25]20.1 percent and 14.8 million in 2009). For related children under the age of 18 in families with a female householder, 44.4 percent were in poverty compared with 11.0 percent of related children in married-couple families. ${ }^{43}$

Both the poverty rate and the number in poverty increased for related children under the age of 6 (from 21.3 percent and 5.3 million in 2008 to 23.8 percent and 6.0 million in 2009). Of related children under the age of 6 in families with a female householder, 54.3 percent were in poverty-four times the rate of related children in married-couple families (13.4 percent).

## Nativity

Of all people, 87.6 percent were native born and 12.4 percent were foreign born. The poverty rate and the number in poverty for the native-born population increased from 12.6 percent and 33.3 million in 2008 to 13.7 percent and 36.4 million in 2009. Among the foreign-born population, 19.0 percent or 7.2 million people lived in poverty in 2009-up from 17.8 percent or 6.5 million people in 2008 (Table 4).

[^26]Figure 5.
Poverty Rates by Age: 1959 to 2009

Notes: The data points are placed at the midpoints of the respective years. For information on recessions, see Appendix A. Data for people aged 18 to 64 and 65 and older are not available from 1960 to 1965.
Source: U.S. Census Bureau, Current Population Survey, 1960 to 2010 Annual Social and Economic Supplements.

Of the foreign-born population, 42.6 percent were naturalized U.S. citizens; the remaining were not U.S. citizens. The poverty rate and the number in poverty in 2009 for naturalized U.S. citizens were 10.8 percent and 1.7 million, estimates not statistically different from 2008. The poverty rate and the number in poverty for those who were not U.S. citizens rose to 25.1 percent and 5.4 million in 2009-up from 23.3 percent and 5.0 million in 2008.

## Region

The poverty rate increased from 2008 to 2009 in three of the four regions, while all four regions had increases in the number of people in poverty. The Midwest poverty rate increased from 12.4 percent to 13.3 percent, and the number in poverty increased from 8.1 million to 8.8 million; the South increased from 14.3 percent to 15.7 percent and from 15.9 million to 17.6 million; and the West increased from 13.5 percent to 14.8 percent and from 9.6 million to 10.5 million. The 2009
poverty rate for the Northeast was 12.2 percent (not statistically different from the 2008 rate), while the number in poverty increased from 6.3 million in 2008 to 6.7 million in 2009.

## Residence

Inside metropolitan statistical areas, the poverty rate and the number of people in poverty were 13.9 percent and 35.7 million in 2009 -up from 12.9 percent and 32.6 million in 2008. Among those living outside metropolitan areas, the poverty rate and the number in poverty were 16.6 percent and 7.9 million in 2009-up from 15.1 percent and 7.3 million in 2008.

Between 2008 and 2009, the poverty rate for people in principal cities increased from 17.7 percent to 18.7 percent, while the number in poverty increased from 17.2 million to 18.3 million. Within metropolitan areas, people in poverty were more likely to live in principal cities. While 38.2 percent of all people living in metropolitan areas in 2009 lived in principal cities,
51.2 percent of poor people in metropolitan areas lived in principal cities. For those inside metropolitan areas but not in principal cities, the poverty rate and the number in poverty rose from 9.8 percent and 15.3 million to 11.0 percent and 17.4 million.

## Work Experience

Among all workers aged 16 and older, both the poverty rate and the number in poverty increased to 6.9 percent and 10.7 million from 6.4 percent and 10.1 million.

Between 2008 and 2009, the increase in poverty among workers was driven almost entirely by those who worked less than full-time, year-round. ${ }^{44}$ Both the percentage and number in poverty increased among less than full-time, year-round workers from 13.5 percent and 7.3 million to 14.5 percent and 8.0 million. For full-time, year-round

${ }^{1}$ A 90 percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_238sa.pdf>.
${ }^{2}$ Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those
 concept). This table shows data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census
 and Other Pacific Islanders, and those reporting two or more races are not shown separately.

Note: Details may not sum to totals because of rounding.
Source: U.S. Census Bureau, Current Population Survey, 2010 Annual Social and Economic Supplement.
workers, the percentage and number in poverty in 2009 were not statistically different from 2008-2.7 percent and 2.6 million. ${ }^{45}$

Among those who did not work at least one week last year, the poverty rate and the number in poverty increased to 22.7 percent and 18.9 million in 2009 from 22.0 percent and 17.1 million in 2008 (Table 4).

[^28]
## Families

The poverty rate and the number of families in poverty were 11.1 percent and 8.8 million in 2009 compared with 10.3 percent and 8.1 million in 2008 (Table 4).

The poverty rate and the number of families in poverty increased across all types of families: married-couple families ( 5.8 percent and 3.4 million in 2009 from 5.5 percent and 3.3 million in 2008); families with a female householder (29.9 percent and 4.4 million in 2009 from 28.7 percent and 4.2 million in 2008); and families with a male householder ( 16.9 percent and

942,000 in 2009 from 13.8 percent and 723,000 in 2008).

## Depth of Poverty

Categorizing a person as "in poverty" or "not in poverty" is one way to describe his or her economic situation. The income-to-poverty ratio and the income deficit or surplus describe additional aspects of economic well-being. While the poverty rate shows the proportion of people with income below the appropriate poverty threshold, the income-to-poverty ratio gauges the depth of poverty. It shows how close a family's income

Figure 6.
Demographic Makeup of the Population at Varying Degrees of Poverty: 2009
(Percent)

Note: Details may not sum to 100 percent because of rounding.
Source: U.S. Census Bureau, Current Population Survey, 2010 Annual Social and Economic Supplement.
is to their poverty threshold. The income-to-poverty ratio is reported as a percentage that compares a family's or an unrelated person's income with the appropriate poverty threshold. For example, a family with an income-to-poverty ratio of 110 percent has income that is 10 percent above their poverty threshold.

The income deficit or surplus shows how many dollars a family's or an unrelated person's income is below (or above) their poverty threshold. For those with an income deficit, the measure is an estimate of the dollar amount necessary to raise a family's or a person's income to their poverty threshold.

## Ratio of Income to Poverty

Table 6 presents the number and percentage of people with specified income-to-poverty ratios-those below 50 percent of poverty ("Under 0.50 "), those below 100 percent of poverty ("Under 1.00," also called "in poverty"), and those below 125 percent of poverty ("Under 1.25").

In 2009, 6.3 percent of all people, or 19.0 million people, had income below one-half of their poverty threshold, up from 5.7 percent and 17.1 million in 2008 . This group represented 43.7 percent of the poverty population in 2009. The percentage and number of people with income below 125 percent of their threshold was 18.7 percent and 56.8 million, up from 17.9 percent and 53.8 million in 2008. For children under the age of 18 in 2009, 9.3 percent and 6.9 million lived in families with income below 50 percent of their poverty threshold, up from 8.5 percent and 6.3 million in 2008 . The percentage and number of children living in families with income below 125 percent of their poverty threshold in 2009 was 26.3 percent and 19.6 million, up from 25.0 percent and 18.6 million in 2008 (Table 6).

The demographic makeup of the population differs at varying degrees of poverty. Children represented 24.5 percent of the overall population, 35.5 percent of the people in poverty, and 36.3 percent of the people with income below 50 percent of their
poverty threshold. On the other hand, the elderly represented 12.7 percent of the overall population, 7.9 percent of the people in poverty, and 5.2 percent of those with income below 50 percent of their poverty threshold. For people with income below 125 percent of their poverty threshold, 34.5 percent were children while 9.7 percent were elderly (Figure 6). ${ }^{46}$

## Income Deficit

The income deficit for families in poverty (the difference in dollars between a family's income and its poverty threshold) averaged \$9,042 in 2009, which was not statistically different from the 2008 estimate. The average income deficit was larger for families with a female householder $(\$ 9,218)$ than for married-couple families $(\$ 8,820)$ (Table 7). ${ }^{47}$

Source: U.S. Census Bureau, Current Population Survey, 2010 Annual Social and Economic Supplement.

The average income deficit per capita for families with a female householder $(\$ 2,776)$ was higher than for married-couple families (\$2,211). The income deficit per capita is computed by dividing the average deficit by the average number of people in that type of family. Since families with a female householder were smaller, on average, than married-couple families, the larger per capita deficit for femalehouseholder families reflects their smaller average family size as well as their lower average family income.

For unrelated individuals in poverty, the average income deficit was $\$ 6,158$ in 2009. The $\$ 5,926$ deficit for women was lower than the $\$ 6,443$ deficit for men. ${ }^{48}$

[^30]
## Alternative/Experimental Poverty Measures

The poverty estimates in this report are based on money income before taxes, do not include the value of noncash benefits, and use the official poverty thresholds. The money income measure does not completely capture the economic well-being of individuals and families; and there are many questions about the adequacy of the official poverty thresholds. Families and individuals also derive economic well-being from noncash benefits, such as food and housing subsidies, and their disposable income is determined by both taxes paid and tax credits received. The official poverty thresholds developed more than 40 years ago do not take into account rising standards of living or such things as child care expenses, other work-related expenses,
variations in medical costs across population groups, or geographic differences in the cost of living. Poverty estimates using the new Supplemental Poverty Measure, which the Census Bureau expects to publish for the first time in September 2011, will address these concerns. For more details, see the text box "Supplemental Poverty Measure" on page 2.

## National Academy of Sciences (NAS)Based Measures and Estimates of the Effect of Benefits and Taxes

The Census Bureau currently computes several alternative measures of income and poverty which fall into two categories: 1) poverty measures based on the 1995 recommendations of the National Academy of Sciences Panel on Poverty and Family Assistance called NAS-based measures
and 2) other income and poverty estimates in the Effect of Benefits and Taxes on Income and Poverty series (R\&D). The NAS-based measures use both alternative poverty thresholds and an expanded income definition. The R\&D estimates use the official thresholds but examine the impact of adding or subtracting specific components from an enhanced definition of income.

The Census Bureau will release estimates for these alternative measures for 2009 at a later date. Estimates for 2008 for the R\&D series can be found at <www.census.gov/hhes/www /cpstables/032009/rdcall/toc.htm> and 2008 estimates for the NAS-based measures can be found at <www.census.gov/hhes/www /povmeas/tables.html>.

The Census Bureau also makes available a research file that provides microdata with variables used to construct the NAS-based alternative measures, available at <www.census.gov/hhes/www /povmeas/datafiles.html>, and an expanded version of the CPS ASEC public-use file that includes estimates of the value of taxes and noncash
benefits, available at <www.bls .census.gov/cps_ftp.html\#cpsmarch>. Both microdata files are currently available for 2008. Data for 2009 will be released before the end of the year.

## CPS Table Creator II

CPS Table Creator II is a Web-based tool designed to help researchers explore alternative income and poverty measures. The tool is available from a link on the Census Bureau's poverty Web site <www.census.gov/hhes/www /cpstc/apm/cpstc_altpov.html>. Table Creator II allows researchers to produce poverty and income estimates using their own combinations of threshold and resource definitions and to see the incremental impact of the addition or subtraction of a single resource element. For example:

- If the cash value of Supplemental Nutrition Assistance Program (SNAP) benefits were added to the money income of families, this would move the family resources of 2.2 million people above the official poverty line in 2008.
- Taking into account the value of the federal Earned Income Tax Credit would reduce the number of
children classified as poor in 2008 by 2 million.
- In 2008, the number of elderly people in poverty would be higher by 13 million people if Social Security payments were excluded from money income, more than quadrupling the number of elderly people in poverty.

Researchers can also estimate poverty rates using alternative poverty thresholds. Many other countries use relative poverty measures with thresholds that are based on a percentage of median or mean income. ${ }^{49}$ Table Creator II allows researchers to estimate poverty rates using a relative poverty threshold calculated as any percentage of mean or median equivalence-adjusted income. For example, using poverty thresholds based on 50 percent of median income rather than the official poverty thresholds would increase the overall poverty rate in 2008 from 13.2 percent to 21.9 percent.
${ }^{49}$ For example, the Organization for Economic Co-operation and Development (OECD) uses a poverty threshold of 50 percent of median income. The European Union defines poverty as an income below 60 percent of the national median of equalized disposable income after social transfers.

## HEALTH INSURANCE COVERAGE IN THE UNITED STATES

## Highlights

- The percentage of people without health insurance increased to 16.7 percent in 2009 from 15.4 percent in 2008. The number of uninsured people increased to 50.7 million in 2009 from 46.3 million in 2008 (Table 8 and Figure 7). ${ }^{50}$
- The number of people with health insurance decreased to 253.6 million in 2009 from 255.1 million in 2008. This is the first year that the number of people with health insurance has decreased since 1987, the first year that comparable health insurance data were collected. The number of people covered by private health insurance decreased to 194.5 million in 2009 from 201.0 million in 2008. The number of people covered by government health insurance increased to 93.2 million in 2009 from 87.4 million in 2008 (Table C-1).
- Between 2008 and 2009, the percentage of people covered by private health insurance decreased from 66.7 percent to 63.9 percent (Figure 8 and Table C-1). The percentage of people covered by employment-based health insurance decreased to 55.8 percent in 2009, from 58.5 percent in 2008. The percentage of people covered by employment-based health insurance is the lowest since 1987, the
${ }^{50}$ For a brief description of how the Census Bureau collects and reports on health insurance data, see the text box "What Is Health Insurance Coverage?" For a discussion of the quality of ASEC health insurance coverage estimates, see Appendix C.

## What Is Health Insurance Coverage?

The Current Population Survey Annual Social and Economic Supplement (CPS ASEC) asks about health insurance coverage in the previous calendar year. Specifically, the survey asks separate questions about the major types of health insurance. People who answer "no" to each of the coverage questions are then asked to verify that they were, in fact, not covered by any type of health insurance. For reporting purposes, the U.S. Census Bureau broadly classifies health insurance coverage as private coverage or government coverage. Private health insurance is a plan provided through an employer or a union or purchased by an individual from a private company. Government health insurance includes such federal programs as Medicare, Medicaid, and military health care; the Children's Health Insurance Program (CHIP); and individual state health plans.* People were considered "insured" if they were covered by any type of health insurance for part or all of the previous calendar year. They were considered "uninsured" if, for the entire year, they were not covered by any type of health insurance.

Research shows health insurance coverage is underreported in the CPS ASEC for a variety of reasons. Annual retrospective questions appear to cause few problems when collecting income data (possibly because the interview period is close to when people pay their taxes). However, because health insurance coverage status can change over the course of a year, answering questions about this long reference period may lead to response errors. For example, some people may report their insurance coverage status at the time of their interview rather than their coverage status during the previous calendar year. Compared with other national surveys, the CPS ASEC's estimate of the number of people without health insurance more closely approximates the number of people who were uninsured at a specific point in time during the year than the number of people uninsured for the entire year. There are several ongoing projects aimed at improving the quality of health coverage data from the CPS ASEC, including cognitive research and field testing to improve the wording of the CPS ASEC health coverage questions.

For more information on the quality of CPS ASEC health insurance estimates, see Appendix C, "Estimates of Health Insurance Coverage." For a comparison between health insurance coverage rates from the major federal surveys, see How Many People Lack Health Insurance and for How Long? (Congressional Budget Office, May 2003) at <www.cbo.gov /doc.cfm?index=4210> and People With Health Insurance: A Comparison of Estimates From Two Surveys, SIPP Working Paper 243, June 2004, at <www.census.gov/sipp/workpapr/sp243.pdf>.

[^32]Figure 7.
Number Uninsured and Uninsured Rate: 1987 to 2009

${ }^{1}$ The data for 1996 through 2003 were revised using an approximation method for consistency with the revision to the 2004 and 2005 estimates.
${ }^{2}$ Implementation of Census 2000-based population controls occurred for the 2000 ASEC, which collected data for 1999. These estimates also reflect the results of follow-up verification questions, which were asked of people who responded "no" to all questions about specific types of health insurance coverage in order to verify whether they were actually uninsured. This change increased the number and percentage of people covered by health insurance, bringing the CPS more in line with estimates from other national surveys.
Notes: Respondents were not asked detailed health insurance questions before the 1988 CPS.
The data points are placed at the midpoints of the respective years. For information on recessions, see Appendix A.
Source: U.S. Census Bureau, Current Population Survey, 1988 to 2010 Annual Social and Economic Supplements.
first year that comparable health insurance data were collected. The number of people covered by employment-based health insurance decreased to 169.7 million in 2009, from 176.3 million in 2008.

- The percentage of people covered by government health insurance programs increased to 30.6 percent in 2009, from 29.0 percent in 2008 (Figure 8 and Table C-1). This is the highest percentage of people covered by government health insurance programs since 1987. The percentage and number of people covered by Medicaid increased to 15.7 percent or 47.8 million in 2009, from 14.1 percent or 42.6 million in 2008. The percentage and number of people covered by Medicaid is the highest since 1987. The percentage and number of
people covered by Medicare in 2009 (14.3 percent and 43.4 million) were not statistically different from 2008. ${ }^{51}$
- In 2009, 10.0 percent of children under 18 , or 7.5 million, were without health insurance. These estimates were not statistically different from the 2008 estimates (Table 8). The uninsured rate for children in poverty (15.1 percent) was greater than the rate for all children. ${ }^{52}$
- Between 2008 and 2009, the uninsured rate and the number of uninsured for non-Hispanic Whites

[^33]increased from 10.8 percent and 21.3 million to 12.0 percent and 23.7 million. The uninsured rate and the number of uninsured for Blacks increased from 19.1 percent and 7.3 million to 21.0 percent and 8.1 million (Table 8).

- The percentage and number of uninsured Hispanics increased to 32.4 percent and 15.8 million in 2009, from 30.7 percent and 14.6 million in 2008 (Table 8).

## Type of Coverage

Most people (55.8 percent) were covered by an employment-based health insurance plan for some or all of 2009. The rate of employment-based coverage in 2009 was lower than the rate in 2008 . This is the lowest rate of employment-based coverage since 1987, the first year that comparable

Figure 8.
Coverage by Type of Health Insurance: 2008 and 2009

* Statistically different at the 90 percent confidence level.
${ }^{1}$ Military health care includes Tricare and CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), as well as care provided by the Department of Veterans Affairs and the military.
Note: The estimates by type of coverage are not mutually exclusive; people can be covered by more than one type of health insurance during the year.
Source: U.S. Census Bureau, Current Population Survey, 2009 and 2010 Annual Social and Economic Supplements.
health insurance data were collected (Table C-1). The rate of private coverage decreased to 63.9 percent in 2009, from 66.7 percent in 2008 (Figure 8). This was the lowest rate of private coverage since 1987. The number of people covered by private insurance also decreased to 194.5 million in 2009, from 201.0 million in 2008.

The percentage of people covered by government health programs increased to 30.6 percent in 2009, from 29.0 percent in 2008 . This was the highest rate of government coverage since 1987. The number of
people covered by government health programs also increased to 93.2 million in 2009, from 87.4 million in 2008. The percentage of people with Medicaid coverage (15.7 percent) was higher in 2009 than in 2008. This was the highest rate of Medicaid coverage since 1987. The number of people covered by Medicaid also increased in 2009 to 47.8 million, from 42.6 million in 2008. In contrast, the percentage and number of people with Medicare coverage in 2009 was not statistically different from 2008, at 14.3 percent and 43.4 million. ${ }^{53}$ In 2009, 11.2 percent of people had no coverage other than Medicaid.

## Race and Hispanic Origin

In 2009, the uninsured rate and the number of uninsured for non-Hispanic Whites increased to 12.0 percent and 23.7 million, from 10.8 percent and 21.3 million in 2008 (Table 8). The uninsured rate and the number of uninsured for Blacks in 2009 were higher than in 2008 , at 21.0 percent and 8.1 million. The uninsured rate and the number of uninsured for Asians in 2009 were not statistically different from 2008, at 17.2 percent and 2.4 million. ${ }^{54}$ Among Hispanics, the uninsured rate and the number of uninsured increased to 32.4 percent and 15.8 million in 2009 from 30.7 percent and 14.6 million in 2008.

## Age

The uninsured rate for those under 65 increased in 2009 to 18.8 percent from 17.3 percent in 2008. In 2009, the percentage of children under 18 without health insurance (10.0 percent) was not statistically different from the percentage reported in 2008. The uninsured rate in 2009 for those aged 65 and older ( 1.8 percent) was also not statistically different from the rate in 2008. The uninsured rate increased for other age groups from 2008 to 2009. For those aged 18 to 24, the rate increased to 30.4 percent from 28.6 percent. For those aged 25 to 34, the rate increased to 29.1 percent from 26.5 percent. For those aged 35 to 44 , the rate increased to 21.7 percent from 19.4 percent. For those aged 45 to 64, the rate increased to 16.1 percent from 14.4 percent.

Since 2007, the year before the most recent recession, the uninsured rate of people under 65 increased to 18.8
${ }^{53}$ The percentage and number of people covered by Medicaid in 2009, 15.7 percent and 47.8 million, were higher than the percentage and number of people covered by Medicare in 2009, 14.3 percent and 43.4 million.
${ }^{54}$ Due to the small sample size, the changes in uninsured rates for Asians are better interpreted when viewed over a longer time period.

[^34]percent from 17.1 percent in 2007. ${ }^{55}$ The uninsured rate of children under 18 decreased to 10.0 percent in 2009 from 11.0 percent in 2007 (Table 9). The uninsured rate of people aged 65 and older in 2009 was not statistically different from the rate in 2007, at 1.8 percent. However, other age groups experienced increases in uninsured rates. Specifically, the uninsured rate of those aged 18 to 24 increased to 30.4 percent in 2009 from 28.1 percent in 2007 . For those aged 25 to 34 , the uninsured rate increased to 29.1 percent in 2009 from 25.7 percent in 2007. The uninsured rate for those aged 35 to 44 was 21.7 percent in 2009, up from 18.3 percent in 2007. For those aged 45 to 64 , the uninsured rate was 16.1 percent in 2009, up from 14.0 percent in 2007.

## Nativity

The uninsured rate and the number of uninsured for the native-born population increased to 14.1 percent and 37.7 million in 2009 from 12.9 percent and 34.0 million in 2008 (Table 8). The uninsured rate and the number of uninsured for the foreign-born population increased to 34.5 percent and 13.0 million in 2009 from 33.5 percent and 12.3 million in 2008. Among the foreign-born population, the uninsured rate increased for noncitizens in 2009 to 46.0 percent from 44.7 percent in 2008 . The uninsured rate in 2009 for naturalized citizens (19.0 percent) was not statistically different from the rate in 2008 . The number of uninsured noncitizens increased to 9.9 million in 2009 from 9.5 million in 2008 . The number of uninsured naturalized citizens increased to 3.0 million in 2009 from 2.8 million in 2008 . The proportion of the foreign-born population without health insurance in 2009 was nearly

[^35]two and one-half times that of the native-born population in 2009.

## Economic Status

The uninsured rate is higher among people with lower incomes (Table 8). In 2009, 26.6 percent of people in households with annual incomes less than $\$ 25,000$ had no health insurance coverage. In 2009, the uninsured rates decreased as household income increased-21.4 percent of people in households with incomes ranging from $\$ 25,000$ to $\$ 49,999$ were uninsured; 16.0 percent of people in households with incomes ranging from $\$ 50,000$ to $\$ 74,999$ were uninsured; and 9.1 percent of people in households with incomes of \$75,000 or more were uninsured.

Among the four household income groups, the uninsured rate in 2009 was not statistically different from 2008 for households with incomes ranging from $\$ 25,000$ to $\$ 49,999$. In 2009, the uninsured rate for people in households with incomes less than $\$ 25,000$ increased to 26.6 percent from 24.5 percent in 2008 . The uninsured rate for households with incomes ranging from $\$ 50,000$ to $\$ 74,999$ increased to 16.0 percent in 2009 from 14.0 percent in 2008. The uninsured rate for people in households with incomes of $\$ 75,000$ or more increased to 9.1 percent in 2009 from 8.2 percent in 2008.

## Work Experience

Between 2008 and 2009, the uninsured rate for workers aged 18 to 64 (people who worked at some time during the year) rose from 18.7 percent to 20.2 percent. The number of workers who were uninsured increased from 27.8 million to 29.3 million. In 2009, full-time, year-round workers were more likely to be covered by health insurance ( 84.8 percent) than those who worked less than full-time, year-round (70.3 percent) or nonworkers (70.9
percent). ${ }^{56,57}$ Among full-time, yearround workers in 2009, the uninsured rate increased to 15.2 percent from 14.6 percent in 2008 . The number of uninsured among full-time, yearround workers ( 14.6 million) was not statistically different from 2008. Among less-than-full-time-year-round workers, the uninsured rate and the number of uninsured increased to 29.7 percent and 14.7 million in 2009 from 27.3 percent and 13.0 million in 2008. Similarly, the uninsured rate and the number of uninsured nonworkers increased to 29.1 percent and 13.2 million in 2009 from 26.0 percent and 10.6 million in $2008 .{ }^{58}$

In 2009, the uninsured rate of fulltime, year-round workers (15.2 percent) was not statistically different from 2007, the first year before the most recent recession (Table 9). The uninsured rate of less-than-full-time-year-round workers increased to 29.7 percent in 2009 from 25.7 percent in 2007 (Table 9). The uninsured rate of those who did not work increased to 29.1 percent in 2009 from 25.4 percent in 2007.

## Children's Health Insurance Coverage

In 2009, the uninsured rate and the number of children under the age of 18 without health insurance ( 10.0 percent and 7.5 million) were not statistically different from 2008 (Table 8). Uninsured rates for children varied by poverty status, age, race, and Hispanic origin. Figure 9 shows that children aged 12 to 17 had a higher

[^36]uninsured rate (11.3 percent) than those under 6 (9.2 percent). ${ }^{59}$ In 2009, children in poverty were more likely to be uninsured ( 15.1 percent) than all children (10.0 percent).

In 2009, the uninsured rates were 7.0 percent for non-Hispanic White children, 11.5 percent for Black children, 10.0 percent for Asian children, and 16.8 percent for Hispanic children. ${ }^{60}$ These 2009 uninsured rates were not statistically different from the respective rates in 2008.

## Region

The Northeast had the lowest uninsured rate in 2009, followed by the Midwest, the West, and the South (Table 8). Between 2008 and 2009, the uninsured rates increased in all four regions-11.6 percent to 12.4 percent in the Northeast; 11.6 percent to 13.3 percent in the Midwest; 17.4 percent to 18.3 percent in the West; and 18.2 percent to 19.7 percent the South. Between 2008 and 2009, the number of uninsured in all four regions increased- 6.3 million to 6.8 million in the Northeast; 7.6 million to 8.8 million in the Midwest; 12.3 million to 13.0 million in the West; and 20.2 million to 22.1 million in the South. ${ }^{61}$

## Residence

The uninsured rate for people living inside metropolitan statistical areas increased to 16.8 percent in 2009 from 15.4 percent in 2008 (Table 8). The uninsured rate in 2009 for people living outside metropolitan areas

[^37]Figure 9.

Age, Race and Hispanic Origin, and Nativity: 2009 Age, Race and Hispanic Origin, and Nativity: 2009

${ }^{1}$ Federal surveys now give respondents the option of reporting more than one race. This figure shows data using the race-alone concept. For example, Asian refers to people who reported Asian and no other race.
Source: U.S. Census Bureau, Current Population Survey, 2010 Annual Social and Economic Supplement.
increased to 16.0 percent from 15.2 percent in 2008. In 2009, the uninsured rate was higher among people living in principal cities (19.7 percent) than among people living inside metropolitan areas but outside principal cities (15.0 percent).

## COMMENTS

The Census Bureau welcomes the comments and advice of data and report users. If you have suggestions or comments on the income and poverty data, please write to:

Charles T. Nelson
Assistant Division Chief, Economic Characteristics
Housing and Household Economic Statistics Division

## U.S. Census Bureau

## Additional Data and Contacts

Detailed tables, historical tables, press releases, and briefings are available electronically on the U.S. Census Bureau's income, poverty, and health insurance Web sites. The Web sites may be accessed through the Census Bureau's home page at <www.census.gov> or directly at <www.census.gov/hhes/www/income/income.html> for income data, <www.census.gov/hhes/www/poverty/poverty.html> for poverty data, and <www.census.gov/hhes/www/hlthins/hlthins.html> for health insurance data.

The Current Population Survey (CPS) Table Creator <www.census.gov /hhes/www/cpstc/cps_table_creator.html> gives you the ability to create customized tables from the CPS Annual Social and Economic Supplement (ASEC). You can generate estimates using your own definitions of income and poverty with CPS Table Creator II <www.census.gov/hhes/www/cpstc /apm/cpstc_altpov.html>.

Microdata are available for download by clicking "Data Tools" on the Census Bureau's home page and then clicking the "DataFerrett" link. Technical methods have been applied to CPS microdata to avoid disclosing the identities of individuals from whom data were collected.

For assistance with income, poverty, or health insurance data or questions about them, contact the Data Integration Division's Information Resources and Dissemination Branch at 301-763-3242 or toll-free at 1-866-758-1060, or search your topic of interest using the Census Bureau's "Question and Answer Center" found at <ask.census.gov>.

## APPENDIX A.

 ESTIMATES OF INCOME
## How Income Is Measured

For each person 15 years and older in the sample, the Annual Social and Economic Supplement (ASEC) asks questions on the amount of money income received in the preceding calendar year from each of the following sources:

1. Earnings
2. Unemployment compensation
3. Workers' compensation
4. Social security
5. Supplemental security income
6. Public assistance
7. Veterans' payments
8. Survivor benefits
9. Disability benefits
10. Pension or retirement income
11. Interest
12. Dividends
13. Rents, royalties, and estates and trusts
14. Educational assistance
15. Alimony
16. Child support
17. Financial assistance from outside of the household
18. Other income

It should be noted that although the income statistics refer to receipts during the preceding calendar year, the demographic characteristics, such as age, labor force status, and household composition, are as of the survey date. The income of the household does not include amounts received by people who were members during all or part of the previous year if these people no longer resided in the household at the time of the

interview. The Current Population Survey (CPS) collects income data for people who are current residents but did not reside in the household during the previous year.

Data on income collected in the ASEC by the U.S. Census Bureau cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, social security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive noncash benefits, such as food stamps, health benefits, subsidized housing, and goods produced and consumed on the farm. In addition, money income does not reflect the fact that noncash benefits are also received by some nonfarm residents, which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical
and educational expenses, etc. Data users should consider these elements when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Based on an analysis of independently derived income estimates, the Census Bureau determined that respondents report income earned from wages or salaries more accurately than other sources of income, and that the reported wage and salary income is nearly equal to independent estimates of aggregate income.

## Recessions

Recessions are defined by the National Bureau of Economic Research. Peak and trough months of recent recessions are shown in the text box above. The data points in the time series charts in this report use July as a reference.

## Annual Average Consumer Price Index Research Series (CPI-U-RS) Using Current Methods All Items: 1947 to 2009

| 1978. . | 104.4 |  |  |

${ }^{1}$ The Census Bureau uses the Bureau of Labor Statistics' Consumer Price Index Research Series (CPI-U-RS) for 1977 through 2009. The Census Bureau derived the CPI-U-RS for years before 1977 by applying the 1977 CPI-U-RS-to-CPI-U ratio to the 1947-to-1976 CPI-U.

Note: Data users can compute the percentage changes in prices between earlier years' data and 2009 data by dividing the annual average CPI-U-RS for 2009 by the annual average for the earlier year(s).

For more information on the CPI-U-RS, see <www.bls.gov/cpi/cpirsdc.htm>.

## Cost-of-Living Adjustment

In order to accurately assess changes in income and earnings over time, an adjustment for changes in the cost of living is required. The Census Bureau uses the research series of the Consumer Price Index (CPI-U-RS), provided by the U.S. Bureau of Labor Statistics for 1977 through 2009, to adjust for changes in the cost of living. The indexes used to make the constant dollar conversions are shown in the text box "Annual Average Consumer Price Index Research Series (CPI-U-RS) Using Current Methods All Items: 1947 to 2009."

${ }^{1}$ Median income is calculated using $\$ 2,500$ income intervals. Beginning with 2009 income data, the Census Bureau expanded the upper income intervals used to calculate medians to $\$ 250,000$ or more. Medians falling in the upper open-ended interval are plugged with " $\$ 250,000$. Before 2009, the upper open
${ }^{4}$ Implementation of Census 2000-based population controls. 2 Data have been revised to reflect a correction to the weigh
${ }^{3}$ Implementation of a 28,000 household sample expansion.
${ }^{4}$ Implementation of Census 2000 -based population controls
${ }^{5}$ Full implementation of 1990 census-based sample design

${ }^{8}$ Implementation of 1990 census population controls.
${ }^{9}$ Implementation of a new CPS ASEC processing system
${ }^{10}$ Recording of amounts for earnings from longest job increased to $\$ 299,999$. Full implementation of 1980 census-based sample design. ${ }^{11}$ Implementation of Hispanic population weighting controls and introduction of 1980 census-based sample design.
${ }^{12}$ Implementation of 1980 census population controls. Questionnaire expanded to show 27 possible values from 51 possible sources of income.
${ }^{13}$ First year medians were derived using both Pareto and linear interpolation. Before this year, all medians were derived using linear interpolation. ${ }^{15}$ Implementation of a new CPS ASEC processing system. Questionnaire expanded to ask 11 income questions
${ }^{16}$ Full implementation of 1970 census-based sample design.
${ }^{18}$ Implementation of new CPS ASEC processing system.
 ${ }^{20}$ For the years 2001 and earlier, the CPS allowed respondents to report only one race group.
${ }^{21}$ Black alone refers to people who reported Black and did not report any other race category.

See footnotes on next page.
${ }^{1}$ Medians are calculated using $\$ 2,500$ income intervals. Beginning with 2009 income data, the Census Bureau expanded the upper income intervals used to calculate medians to
 used.
${ }^{2}$ Data have been revised to reflect a correction to the weights in the 2005 ASEC.
${ }^{3}$ Implementation of a 28,000 household sample expansion.
${ }^{4}$ Implementation of Census 2000-based population controls.
${ }^{5}$ Full implementation of 1990 census-based sample design and metropolitan definitions, 7,000 household sample reduction, and revised editing of responses on race.
${ }^{6}$ Introduction of 1990 census sample design.
 on selected questionnaire items. Limits either increased or decreased in the following categories: earnings limits increased to $\$ 999,999$; social security limits increased to $\$ 49,999$;

${ }^{8}$ Implementation of 1990 census population controls.
${ }^{9}$ Implementation of a new CPS ASEC processing system.
${ }^{10}$ Recording of amounts for earnings from longest job increased to $\$ 299,999$. Full implementation of 1980 census-based sample design.
${ }^{11}$ Implementation of Hispanic population weighting controls and introduction of 1980 census-based sample design.
${ }^{12}$ Implementation of 1980 census population controls. Questionnaire expanded to allow the recording of up to 27 possible values from a list of 51 possible sources of income.
${ }^{13}$ First year medians were derived using both Pareto and linear interpolation. Before this year, all medians were derived using linear interpolation.
${ }^{14}$ Some of these estimates were derived using Pareto interpolation and may differ from published data, which were derived using linear interpolation.
${ }^{15}$ Implementation of a new CPS ASEC processing system. Questionnaire expanded to ask 11 income questions.
${ }^{16}$ Full implementation of 1970 census-based sample design.
${ }^{17}$ Introduction of 1970 census sample design and population controls.
${ }^{18}$ Implementation of a new CPS ASEC processing system.

Selected Measures of Equivalence-Adjusted Income Dispersion: 1967 to 2009—Con.
(For further explanation of income inequality measures, see Current Population Reports, Series P60-204, The Changing Shape of the Nation's Income Distribution: 1947-1998.

[^38]${ }^{1}$ Data have been revised to reflect a correction to the weights in the 2005 ASEC. ${ }^{2}$ Implementation of a 28,000 household sample expansion. ${ }^{6}$ Data collection method changed from paper and pencil to computer-assisted interviewing. In addition, the 1994 ASEC was revised to allow for the coding of different income amounts on selected
questionnaire items. Limits either increased or decreased in the following categories: earnings limits increased to $\$ 999,999$; social security limits increased to $\$ 49,999$; supplemental security income and public
assistance limits increased to $\$ 24,999$; veterans'benefits limits increased to $\$ 99,999$; child support and alimony limits decreased to $\$ 49,999$. ${ }^{7}$ Implementation of 1990 census population controls.

[^39]${ }^{3}$ Implementation of Census 2000-based population controls.
${ }^{4}$ Full implementation of 1990 census-based sample design and metropolitan definitions, 7,000 household sample reduction, and revised editing of responses on race.
${ }^{5}$ Introduction of 1990 census sample design.

[^40]Table A-4.

## Number and Real Median Earnings of Total Workers and Full-Time, Year-Round Workers by Sex and Female-to-Male Earnings Ratio: 1960 to 2009

(People 15 years old and older beginning in 1980 and people 14 years old and older as of the following year for previous years. Before 1989 earnings are for civilian workers only. Earnings in 2009 CPI-U-RS adjusted dollars. For information on confidentiality protection, sampling error, nonsampling error, and definitions, see www.census.gov/apsd/techdoc/cps/cpsmar10.pdf)

| Year | Total workers |  |  |  |  |  |  |  | Full-time, year-round workers |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Male |  |  |  | Female |  |  |  | Male |  |  |  | Female |  |  |  | Female-tomale earnings ratio |

(NA) Not available.
Medians are calculated using $\$ 2,500$ income intervals. Beginning with 2009 income data, the Census Bureau expanded the upper income intervals used to calculate medians to $\$ 250,000$ or more. Medians falling in the upper open-ended interval are plugged with " $\$ 250,000$." Before 2009 , the upper open-ended interval was $\$ 100,000$ and a plug of " $\$ 100,000$ " was used.
${ }^{2}$ The 2004 data have been revised to reflect a correction to the weights in the 2005 ASEC.
${ }^{3}$ Implementation of a 28,000 household sample expansion.
${ }^{4}$ Implementation of Census 2000-based population controls.
${ }^{5}$ Full implementation of 1990 census-based sample design and metropolitan definitions, 7,000 household sample reduction, and revised editing of responses on race.
${ }^{6}$ Introduction of 1990 census sample design.
Data collection method changed from paper and pencil to computer-assisted interviewing. In addition, the 1994 ASEC was revised to allow for the coding of different income amounts on selected
 public assistance limits increased to $\$ 24,999$; veterans' benefits limits increased to $\$ 99,999$; child support and alimony limits decreased to $\$ 49,999$
${ }^{8}$ Implementation of 1990 census population controls
${ }^{9}$ Implementation of a new CPS ASEC processing system
${ }^{10}$ Recording of amounts for earnings from longest job increased to $\$ 299,999$. Full implementation of 1980 census-based sample design.
${ }^{11}$ Implementation of Hispanic population weighting controls and introduction of 1980 census-based sample design.
${ }^{12}$ Implementation of 1980 census population controls. Questionnaire expanded to allow the recording of up to 27 possible values from a list of 51 possible sources of income.
${ }^{13}$ First year medians were derived using both Pareto and linear interpolation. Before this year, all medians were derived using linear interpolation.
${ }^{14}$ Some of these estimates were derived using Pareto interpolation and may differ from published data, which were derived using linear interpolation.
${ }^{15}$ Implementation of a new CPS ASEC processing system. Questionnaire expanded to ask 11 income questions.
${ }^{16}$ Full implementation of 1970 census-based sample design.
${ }^{17}$ Introduction of 1970 census sample design and population controls.
${ }^{18}$ Implementation of a new CPS ASEC processing system.
${ }^{19}$ Questionnaire expanded to ask eight income questions.
${ }^{20}$ Implementation of new procedures to impute missing data only.
${ }^{21}$ Full implementation of 1960 census-based sample design and population controls.
${ }^{22}$ Introduction of 1960 census-based sample design. Implementation of first hotdeck procedure to impute missing income entries.

Table A-5.
Number of Workers With Earnings and Median Earnings by Work Experience, Sex, and Selected Characteristics: 2002 to 2009-Con.
(Earnings in 2009 CPI-U-RS adjusted dollars. For information on confidentiality protection, sampling error, nonsampling error, and definitions, see www.census.gov/apsd/techdoc/cps/cpsmar10.pdf. Comparable data for occupation categories not available
prior to 2002 due to change in occupation designations and definitions)

(X) Not applicable.
(B) Based rounds to 75,000 or less.
${ }_{2}^{1}$ Data have been revised to reflect a correction to the weights in the 2005 ASEC.
2Medians are calculated using $\$ 2,500$ income intervals. Seginning with 2000 income data, the Census Bureau expanded the upper income intervals used to calculate medians to $\$ 250,000$ or more. Medians falling in the upper open-ended interval are
plugged with $\$ 250,000$." Before 2009 , the upper open-ended interal was $\$ 100,000$ and a plug of $\$ 100,000$ " was used.

## APPENDIX B.

## ESTIMATES OF POVERTY

## How Poverty Is Calculated

Following the Office of Management and Budget's (OMB) Statistical Policy Directive 14, the U.S. Census Bureau uses a set of dollar value thresholds that vary by family size and composition to determine who is in poverty (see the matrix below).

Poverty Thresholds for 2009 by Size of Family and Number of Related Children Under 18 Years (Dollars)

| Size of family unit | Related children under 18 years |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | None | One | Two | Three | Four | Five | Six | Seven | Eight or more |
| One person (unrelated individual): Under 65 years 65 years and older | $\begin{aligned} & 11,161 \\ & 10,289 \end{aligned}$ |  |  |  |  |  |  |  |  |
| Two people: Householder under 65 years . . Householder 65 years and older | $\begin{aligned} & 14,366 \\ & 12,968 \end{aligned}$ | $\begin{aligned} & 14,787 \\ & 14,731 \end{aligned}$ |  |  |  |  |  |  |  |
| Three people | 16,781 | 17,268 | 17,285 |  |  |  |  |  |  |

If a family's total money income is less than the applicable threshold, then that family and every individual in it are considered in poverty. The official poverty thresholds are updated annually for inflation using the Consumer Price Index (CPI-U). Since the average annual CPI-U for 2009 was lower than the average annual CPI-U for 2008, poverty thresholds for 2009 are slightly lower than the corresponding thresholds for 2008. The official poverty definition uses money income before taxes and tax credits and excludes capital gains and noncash benefits (such as Supplemental Nutrition Assistance Program benefits and housing assistance). The thresholds do not vary geographically.

Example: Suppose Family A consists of five people: two children, their mother, their father, and their greataunt. Family A's poverty threshold in 2009 was $\$ 26,245$. Each member of Family A had the following income in 2009:

| Mother | $\$ 10,000$ |
| :--- | ---: |
| Father | 7,000 |
| Great-aunt | 10,000 |
| First child | 0 |
| Second child | 0 |
| Total: | $\$ 27,000$ |

Since their total family income, $\$ 27,000$, was higher than their threshold ( $\$ 26,245$ ), Family A would not be considered "in poverty."

While the thresholds, in some sense, represent the needs of families, they should be interpreted as a statistical yardstick rather than as a complete description of what people and families need to live. Many government assistance programs use different income eligibility cutoffs. While official poverty rates and the number of people or families in poverty are important, other poverty indicators are considered in the section, "Depth of Poverty Measures," and other approaches to setting thresholds and defining resources are discussed in the section, "Alternative Poverty Measures."

For a history of the official poverty measure, see "The Development of
the Orshansky Poverty Thresholds and Their Subsequent History as the Official U.S. Poverty Measure" by Gordon M. Fisher, available at <www.census.gov/hhes/www /povmeas/papers/orshansky.html>.

Weighted average thresholds: Since some data users want a summary of the 48 thresholds to get a general sense of the "poverty line," the following table provides the weighted average thresholds for 2009. The averages are based on the relative number of families of each size and composition and are not used in computing poverty estimates.

| Weighted Average Poverty <br> Thresholds in 2009 by Size <br> of Family |  |
| :--- | ---: |
| (Dollars) |  |
| One person | 10,956 |
| Two people | 13,961 |
| Three people | 17,098 |
| Four people | 21,954 |
| Five people | 25,991 |
| Six people | 29,405 |
| Seven people | 33,372 |
| Eight people | 37,252 |
| Nine people or more | 44,366 |

## (NA) Not available

${ }^{1}$ For 2004, figures are revised to reflect a correction to the weights in the 2005 ASEC
${ }^{2}$ Consistent with 2001 data through implementation of Census 2000-based population controls and a 28,000 household sample expansion.
${ }^{3}$ For 1999, figures are based on Census 2000 population controls.
${ }^{4}$ For 1992, figures are based on 1990 census population controls.
${ }^{5}$ For 1991, figures are revised to correct for nine omitted weights from the original March 1992 CPS file.
${ }^{6}$ For 1988 and 1987, figures are based on new processing procedures and are also revised to reflect corrections to the files after publication of the 1988 advance report Money Income and Poverty Status in the United States: 1988, P-60, No. 166
${ }^{7}$ The 2003 CPS allowed respondents to choose more than one race. White alone refers to people who reported White and did not report any other race category. The use of this singlerace population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White and American Indian and Alaska Native or Asian and Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000
${ }^{8}$ For 2001 and earlier years, the CPS allowed respondents to report only one race group. The reference race groups for 2001 and earlier poverty data are White, non-Hispanic White, Black, and Asian and Pacific Islander.
${ }^{9}$ Black alone refers to people who reported Black and did not report any other race.
${ }^{10}$ Asian alone refers to people who reported Asian and did not report any other race.
Note: Prior to 1979, people in unrelated subfamilies were included in people in families. Beginning in 1979, people in unrelated subfamilies are included in all people but are excluded from people in families

(NA) Not available.
${ }^{1}$ For 2004, figures are revised to reflect a correction to the weights in the 2005 ASEC.
${ }^{2}$ Consistent with 2001 data through implementation of Census 2000-based population controls and a 28,000 household sample expansion.
${ }^{3}$ For 1999, figures are based on Census 2000 population controls.
${ }^{4}$ For 1992, figures are based on 1990 census population controls.
${ }^{5}$ For 1991, figures are revised to correct for nine omitted weights from the original March 1992 CPS file.
${ }^{6}$ For 1988 and 1987, figures are based on new processing procedures and are also revised to reflect corrections to the files after publication of the 1988 advance report Money Income and Poverty Status in the United States: 1988, P-60, No. 166.
${ }^{7}$ The 2003 CPS allowed respondents to choose more than one race. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White and American Indian and Alaska Native or Asian and Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000.
${ }^{8}$ For 2001 and earlier years, the CPS allowed respondents to report only one race group. The reference race groups for 2001 and earlier poverty data are White, non-Hispanic White, Black, and Asian and Pacific Islander.
${ }^{9}$ Black alone refers to people who reported Black and did not report any other race.
${ }^{10}$ Asian alone refers to people who reported Asian and did not report any other race.
Note: Before 1979, people in unrelated subfamilies were included in people in families. Beginning in 1979, people in unrelated subfamilies are included in all people but are excluded from people in families.

## APPENDIX C. ESTIMATES OF HEALTH INSURANCE COVERAGE

## Quality of Health Insurance Coverage Estimates

National surveys and health insurance coverage. Health insurance coverage is likely to be underreported on the Current Population Survey (CPS). While underreporting affects most, if not all, surveys, underreporting of health insurance coverage appears to be a larger problem in the Annual Social and Economic Supplement (ASEC) than in other national surveys that ask about insurance. Some reasons for the disparity may include the fact that income, not health insurance, is the main focus of the ASEC questionnaire. In addition, the ASEC collects health insurance information in February through April but asks about the previous year's coverage. Asking annual retrospective questions appears to cause few problems when collecting income data (possibly because the interview period is close to when people pay their taxes), but it may be less than ideal when asking about health insurance coverage. Compared with other national surveys, the CPS estimate of the number of people without health insurance more closely approximates the number of people who are uninsured at a specific point in time during the year than the number of people uninsured for the entire year. For a comparison of health insurance coverage rates from the major federal surveys, see How Many People Lack Insurance and for How Long? (Congressional Budget Office, May 2003).

Reporting of coverage through major federal health insurance programs. The CPS ASEC data underreport Medicare and Medicaid coverage compared with enrollment and participation data from the Centers for Medicare and Medicaid Services (CMS) ${ }^{1}$. Because the CPS is largely a labor force survey, interviewers receive less training on health insurance concepts than labor concepts. Additionally, many people may not be aware that a health insurance program covers them or their children if they have not used covered services recently. CMS data, on the other hand, represent the actual number of people who have enrolled or participated in these programs.

The State Health Access Data Assistance Center (SHADAC) of the University of Minnesota has worked with the U.S. Census Bureau, CMS, and the Office of the Assistant Secretary for Planning and Evaluation (ASPE) on a research project to evaluate why CPS ASEC estimates of the number of people with Medicaid are lower than counts of the number of people enrolled in the program from CMS. Reports from all four phases of the research project are available from the Census Bureau's Web site at <www.census.gov/did/www/snacc/>.

During Phase 2, files from the Medicaid Statistical Information System (MSIS) were linked with the CPS ASEC files and the individual records were compared. The report from Phase 2 showed a gap between CPS ASEC estimates and MSIS files of
${ }^{1}$ CMS is the federal agency primarily responsible for administering the Medicare and Medicaid programs at the national level.
2.8 million Medicaid enrollees. A key finding indicating survey response error in the CPS ASEC was that 16.9 percent of people with an MSIS record indicating Medicaid coverage reported in the CPS ASEC that they were uninsured. ${ }^{2}$ The report found that Medicaid subscribers with longer and more recent enrollment were more likely to report coverage. Respondents for children enrolled in Medicaid were more apt to report coverage for those children than for enrolled adults within the household. Families with lower incomes tended to report coverage more frequently. Individuals who received Medicaid services during the reporting cycle tended to report coverage more often than individuals who had not received services. Reporting differences were also apparent among states.

Phase 3 of the research project is further broken down into three steps that attempt to account for discrepancies found in Phase 2 between the MSIS records and the CPS ASEC files. These steps focus on determining the number of enrollees who were out-of-scope for the 2001 March CPS interview (people living in institutions and other group quarters are not eligible for CPS ASEC interview; MSIS counts all people, regardless of their living situation). Phase 3 narrowed the gap between CPS ASEC estimates and MSIS files by 1.0 million, to 1.8 million Medicaid enrollees.

Phase 4 consisted of repeating the Phase 2 process using the National

[^48]Health Interview Survey (NHIS) data instead of CPS data. The purpose of this was two-fold: to provide explanations for the differences found between NHIS data and MSIS files and to examine how differing survey designs and methodologies affect the survey data and estimates. The report found that the NHIS Medicaid undercount was 27.3 percent in 2001 and 21.7 percent in 2002, but noted that the NHIS added questions in 2004 and these results may not apply to more recent data. The report found higher false-negative reporting for enrollees who were older, had higher incomes and also had private insurance. Falsenegative reporting was lower for very low-income enrollees, those on other benefits programs, and those who had recently used Medicaid services. The report found that the dynamics of false-negative reporting was similar in NHIS and CPS.

In November of 2008, SHADAC released a new imputation adjustment for public use CPS ASEC microdata through their website to help researchers interested in partially
adjusting the CPS ASEC data. ${ }^{3}$ This is an experimental imputation, and was produced for interested parties to use in their research. The Census Bureau has not evaluated the methodology, and users should be aware that this is not an official data product.

There are several ongoing projects aimed at improving the quality of health coverage data from the CPS ASEC. This research includes: 1) cognitive research and field testing to improve the wording of the CPS ASEC health coverage questions; 2) editing and imputation research, including additional research on the use of models that attempt to account for Medicaid underreporting; and 3) expanding the number of studies that match administrative Medicaid data to current survey data to include other surveys, such as the National Health Interview Survey (NHIS) and the American Community Survey (ACS). This research will make it possible

[^49]to compare and contrast CPS ASEC underreporting rates with other surveys. This, in turn, will allow Census Bureau analysts to better understand the nature and impact of CPS ASEC health coverage underreporting.

After consulting with health insurance experts, the Census Bureau modified the definition of the population without health insurance in the supplement to the March 1998 CPS, which collected data about coverage in 1997. Previously, people with no coverage other than access to the Indian Health Service were counted as part of the insured population. Subsequently, the Census Bureau has counted these people as uninsured. In 2009, a modification to uninsured foster children was made. Health insurance experts informed the Census Bureau that all foster children were eligible for Medicaid. The effect of these changes on the overall estimates of health insurance coverage was negligible.

Table C-1
Health Insurance Coverage: 1987 to 2009
(Numbers in thousands. People as of March of the following year. For information on confidentiality protection, sampling error, nonsampling error, and definitions, see www.census.gov/apsd/techdoc/cps/cpsmar10.pdf)

| Year |  | Total people | Covered by private and/or government health insurance |  |  |  |  |  |  |  | Not covered |

(NA) Not available. Respondents were not asked detailed health insurance questions about direct-purchase coverage before the 1995 Current Population Survey (CPS) Annual Economic and Economic (ASEC) Supplement.
${ }^{1}$ Military health care includes Tricare and CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), as well as care provided by the Health and Medical Program of the Department of Veterans Affairs and care provided by the Department of Veterans Affairs and the military.
${ }_{3}^{2}$ The 2004 and 2005 data were revised in March 2007. See <www.census.gov/hhes/www/hlthins/data/usernote/index.html>.
${ }^{3}$ Implementation of a 28,000 household sample expansion.
${ }^{4}$ Estimates reflect the results of follow-up verification questions and implementation of Census 2000-based population controls.
${ }^{5}$ Beginning with the 1998 CPS ASEC, people with no coverage other than access to Indian Health Service are no longer considered covered by health insurance; instead, they are considered to be uninsured. The effect of this change on the overall estimates of health insurance coverage is negligible; however, the decrease in the number of people covered by Medicaid may be partially due to this change.
 Poverty, and Health Insurance Coverage in the United States: 2005 at <www.census.gov/prod/2006pubs/p60-231.pdf>.
${ }^{7}$ Health insurance questions were redesigned. Increases in estimates of employment-based and military health care coverage may be partially due to questionnaire changes. Overall coverage estimates were not affected.
${ }^{8}$ Data collection method changed from paper and pencil to computer-assisted interviewing.
${ }_{10}^{9}$ Implementation of 1990 census population controls.
${ }^{10}$ Implementation of a new CPS ASEC processing system.

${ }^{1}$ Military health care includes Tricare and CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), as well as care provided by the Health and Medical Program of the Department of Veterans Affairs and care provided by the Department of Veterans Affairs and the military.
${ }^{2}$ The 2004 and 2005 data were revised in March 2007. See <www.census.gov/hhes/www/hlthinsdata/usernote/index.html>.
${ }^{3}$ Implementation of a 28,000 household sample expansion.
${ }^{4}$ The 2003 CPS asked respondents to choose one or more races. White alone refers to people who reported White and did not report any other race category. The use of this singlerace population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White and American Indian and Alaska Native or Asian and Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000.
${ }^{5}$ The 2001 CPS and earlier years asked respondents to report only one race. The reference groups for these years are White, White not Hispanic, Black, and Asian and Pacific Islander.
${ }^{6}$ Black alone refers to people who reported Black or African American and did not report any other race.
${ }^{7}$ Asian alone refers to people who reported Asian and did not report any other race.
Note: All years reflect the implementation of the verification question. The data for 1999 through 2003 were revised using an approximation method for consistency with the revision to the 2004 and 2005 estimates. To see the original series, see Table C-1 in Income, Poverty, and Health Insurance Coverage in the United States: 2005 at <www.census.gov/prod/2006pubs /p60-231.pdf>.

[^55]Source: U.S. Census Bureau, Current Population Survey, 2000 to 2010 Annual Social and Economic Supplements.

[^0]:    ${ }^{1}$ All income values are adjusted to reflect 2009 dollars. "Real" refers to income after adjusting for inflation. The adjustment is based on percentage changes in prices between 2009 and earlier years and is computed by dividing the annual average Consumer Price Index Research Series (CPI-U-RS) for 2009 by the annual average for earlier years. The CPI-U-RS values for 1947 to 2009 are available in Appendix A and on the Internet at <www.census.gov/hhes /www/income/data/incpovhlth/2009/p60no238 _appacpitable.pdf>. Consumer prices between 2008 and 2009 fell by 0.4 percent.

[^1]:    * U.S. island areas include American Samoa, Guam, the Commonwealth of the Northern Mariana Islands, and the Virgin Islands of the United States.

[^2]:    ${ }^{2}$ Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). The body of this report (text, figures, and tables) shows data using the first approach (race alone). The appendix tables show data using both approaches. Use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety

[^3]:    *The 2004 SIPP panel collected data from February 2004 through January 2008. The data are currently available for download. See the SIPP Web site for details <www.sipp.census.gov/sipp>.

[^4]:    ${ }^{3}$ Native-born households are those in which the householder was born in the United States, Puerto Rico, or the U.S. island areas of Guam, the Commonwealth of the Northern Mariana Islands, American Samoa, or the Virgin Islands of the United States or was born in a foreign country but had at least one parent who was a U.S. citizen. All other households are considered foreign born regardless of the date of entry into the United States or citizenship status. The CPS does not interview households in Puerto Rico. Of all householders, 86.8 percent were native born; 6.7 percent were foreign born, naturalized citizens; and 6.5 percent were noncitizens (the difference in the percentage of householders who were naturalized citizens and those who were noncitizens is not statistically significant).
    ${ }^{4}$ The difference in the declines in median household income between the Midwest and West was not statistically significant.
    ${ }^{5}$ For a discussion of these two income measures, see "What Are Shares of Aggregate Household Income and a Gini index?," in Bishaw, Alemayehu and Jessica Semega, Income, Earnings, and Poverty Data From the 2007 American Community Survey, American Community Survey Reports, ACS-09, U.S. Census Bureau, August 2008, <www.census.gov/prod/2008pubs /acs-09.pdf>.

[^5]:    ${ }^{6}$ The difference between the percentage increases in the earnings of men and women was not statistically significant.

[^6]:    ${ }^{7}$ The difference between the declines for the overall and White populations was not statistically significant.
    ${ }^{8}$ Unlike medians, per capita and means are affected by extremely high and low incomes.
    ${ }^{9}$ The difference between the percentage declines of 2007 to 2009 and 1999 to 2009 in median household income was not statistically significant. In addition, the difference between the 1999 and 2007 medians is not statistically significant. The median household income peak of $\$ 52,388$ in 1999 and the $\$ 52,301$ median household income in 2000 are not statistically different.

[^7]:    ${ }^{10}$ Recessions are determined by the National Bureau of Economic Research, a private research organization. See Appendix A for a list of peak and trough months.
    ${ }^{11}$ Discussion is limited to recessions occurring after 1967, the first year that household income estimates were derived from the CPS ASEC.
    ${ }^{12}$ The difference between the declines in income for the combined January 1980 to July 1980 and July 1981 to November 1982 recessions and the November 1973 to March 1975 recession was not statistically significant.

[^8]:    ${ }^{13}$ Except for the differences between the decline for Blacks compared with the declines for non-Hispanic Whites and Asians and the difference between the declines for non-Hispanic Whites and Hispanics, the differences between the remaining declines were not statistically significant. For all races, the median household income peak of $\$ 52,388$ in 1999 was not statistically different from the 2000 median of $\$ 52,301$. For non-Hispanic Whites, the $\$ 56,843$ income peak in 1999 was not statistically different from the 2000 median of $\$ 56,826$. For Blacks, the $\$ 36,952$ income peak in 2000 was not statistically different from the 1999 median of $\$ 35,928$. For Hispanics, the $\$ 41,312$ income peak in 2000 was not statistically different from the 2001 median of $\$ 40,665$.

[^9]:    ${ }^{14}$ Except for the difference between the declines in the income of households with householders under 65 compared with the decline for those aged 15 to 24 , the differences among the declines discussed in this paragraph were not statistically significant.

[^10]:    ${ }^{18}$ An article by Paul Allison, "Measures of Inequality," American Sociological Review, 43, December 1977, pp. 865-880, provides an explanation of inequality measures.
    ${ }^{19}$ Caution should be used in making direct comparisons with years earlier than 1993 because of substantial methodological changes in the 1994 CPS ASEC. In that year, the Census Bureau introduced computer-assisted interviewing and increased income reporting limits.

[^11]:    ${ }^{20}$ For further discussion of how high incomes reported in the CPS ASEC affect income distribution measures, see, Semega, Jessica and Ed WeIniak, "Evaluating the Impact of Unrestricted Income Values on Income Distribution Measures Using the Current Population Survey's Annual Social and Economic Supplement (ASEC)," April 2007, <www.census.gov/hhes/www/income /publications/unrestrict-tables/index.html>.

[^12]:    ${ }^{21}$ The three-parameter scale used here is the same as the one used in the report The Effect of Taxes and Transfers on Income and Poverty in the United States: 2005, Current Population Reports, P60-232, U.S. Census Bureau, March 2007, <www.census.gov/prod/2007pubs/p60 -232.pdf>. The three-parameter scale was applied to the incomes of families and unrelated individuals and assigned to each family member or unrelated individual living within the household. For details on the derivation of the threeparameter scale, see Short, Kathleen, Experimental Poverty Measures: 1999, Current Population Reports, P60-216, U.S. Census Bureau, October 2001, <www.census.gov/prod/2001pubs /p60-216.pdf>.

[^13]:    - Represents or rounds to zero.
    * Statistically different from zero at the 90 percent confidence level.
    ${ }^{1}$ A 90 percent confidence interval (C.I.) is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_238sa.pdf>.

    Source: U. S. Census Bureau, Current Population Survey, 2009 and 2010 Annual Social and Economic Supplements.

[^14]:    ${ }^{22}$ Higher values for the epsilon parameter (e) when calculating the Atkinson measure increases sensitivity of changes at the lower end of the distribution, while lower values increase sensitivity of changes at the upper end of the distribution.
    ${ }^{23}$ The difference between the percentage changes in the Atkinson measure based on $e=0.25$ and $e=0.75$ was not statistically significant.
    ${ }^{24}$ This is the first year a historical series of equivalence-adjusted income inequality has been produced back to 1967.

[^15]:    ${ }^{25}$ The differences between the percentage changes in the equivalence-adjusted Atkinson measure based on each epsilon were not statistically significant. The difference between the percentage changes in the money income Atkinson measure based on $e=0.50$ and $e=0.75$ was not statistically significant.

[^16]:    ${ }^{27}$ The differences among the percentage increases in the earnings of full-time, year-round working men compared with the increases for total working women and women working fulltime, year-round were not statistically different. The difference between the 2009 median earnings of all working men and of full-time, year-round working women was not statistically significant.
    ${ }^{28}$ The difference between the declines in earnings for the income years surrounding the March 2001 and November 2001 recession and the December 1969 to November 1970 recession was not statistically significant.

[^17]:    ${ }^{29}$ The difference between the declines in earnings for income years surrounding the July 1990 to March 1991 recession and the November 1973 to March 1975 recession was not statistically significant.

[^18]:    ${ }^{30}$ The following differences among the declines in number of workers were not statistically significant: the decline in the number of men 15 to 24 compared with the declines for men 25 to 44 and women 25 to 44, the decline in the number of men 25 to 44 compared with the declines for women 15 to 24 and 25 to 44 , the decline in the number of women 15 to 24 compared with that for women 25 to 44.
    ${ }^{31}$ All of the differences among the declines discussed in this paragraph were not statistically significant. In addition, the differences between the increases in the number of women with an associate's degree and those with a bachelor's degree were not statistically significant.

[^19]:    ${ }^{32}$ Except for the following differences, the differences among the declines in this paragraph were not statistically significant: The difference between the decline in the number of females in production occupations compared with the declines for males in sales and related occupations and females in office and administrative support occupations; the difference between the decline in the number of males in construction and extraction occupations and females in management, business, and financial operations occupations; and the difference between the decline in the number of females in office and administrative support occupations compared with the declines in the number of females in management, business, and financial operations occupations and males in production occupations and transportation and material-moving occupations. In addition, the difference between the increases in the number of females in professional and related occupations and those in service occupations was not statistically significant.

[^20]:    ${ }^{33}$ The per capita income data presented in this report are not directly comparable with estimates of personal per capita income prepared by the Bureau of Economic Analysis, U.S.
    Department of Commerce. The lack of correspondence stems from the differences in income definition and coverage. For further details, see <www.census.gov/hhes/www/income /comparel.html>.

[^21]:    ${ }^{34}$ Unlike medians, per capita and means are affected by extremely high and low incomes.
    ${ }^{35}$ The difference between the per capita incomes of the non-Hispanic-White and Asian populations was not statistically significant.
    ${ }^{36}$ The difference between the declines for the overall and White populations was not statistically significant.

[^22]:    ${ }^{37}$ OMB determined the official definition of poverty in Statistical Poverty Directive 14. Poverty thresholds are updated each year using the change in the average annual Consumer Price Index for All Consumers (CPI-U). Since the average annual CPI-U for 2009 was lower than the average annual CPI-U for 2008, poverty thresholds for 2009 are slightly lower ( 0.4 percent) than the corresponding thresholds for 2008. Appendix B provides a more detailed description of how the Census Bureau calculates poverty.

[^23]:    - Represents or rounds to zero.
    * Statistically different from zero at the 90 percent confidence level.
     see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_238sa.pdf>.
    ${ }^{2}$ Details may not sum to totals because of rounding
    ${ }^{3}$ Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those
    
    
    
     from Census 2000 through American FactFinder. About 2.6 percent of people repor
    Pacific Islanders, and those reporting two or more races are not shown separately.
    ${ }^{4}$ The "Outside metropolitan statistical areas" category includes both micropolitan statistical areas and territory outside of metropolitan and micropolitan statistical areas. For more information, see "About Metropolitan and Micropolitan Statistical Areas" at <www.census.gov/population/www/estimates/aboutmetro.html>.
